FOREWORD

About a year and a half ago, the ECLA Mexico Office prepared a note containing some considerations on the present situation and future prospects of the Central American economies and the adverse effects which the critical situation through which they were passing could have, particularly for the process of regional economic integration.<sup>1</sup>/\*/ A warning was given on that occasion that the economies of the subregion, both individually and as a whole, were beginning to suffer rapid deterioration on account of factors of both external and internal origin, and that if nothing was done to deal with this situation it could imperil the level of economic interdependence reached through the integration programme, to the detriment of one of the relatively autonomous sources of growth for Central America. In order to lessen or even reverse these depressive tendencies, it was proposed that machinery should be set up to heighten international collaboration with a view to strengthening the activities which the countries of the subregion would have to carry out themselves.

Since then, it has been observed that the situation of the Central American economies has deteriorated even more than was foreseen in that note and that international co-operation has not played the role which was hoped for. Furthermore, the degree of economic interdependence reached in previous years -measured through intra-Central American trade flows- underwent a decline in 1982, partly as a reflection of the world recession affecting all the countries of the region to different degrees.

In view of the seriousness of the situation, which combines an economic and a political crisis which are without precedents in recent times, and in view of the generalized confusion as regards the way to tackle these problems, it has seemed appropriate to go more deeply into the causes, characteristics and consequences of these crises and to put forward some suggestions regarding possible policy options which could be adopted by governments. Although the main emphasis is on matters which are the normal concern of the Economic Commission for Latin America, topics are also discussed which are not usually dealt with in the Commission's

---

\*/ The notes are given at the end of this document.

analyses, since it seems impossible to deal with the present economic development of the Central American countries without taking account of phenomena which correspond to the political and social field.

It is not pretended, of course, to offer global solutions or set models for solving problems of such great complexity. The approach is rather to emphasize in the first place the novel nature of the present crisis, and in the second place to formulate some guidelines which could facilitate the adaptation of these countries to the changed circumstances inside and outside the subregion. Within these guidelines, special emphasis is placed on the activities which could be embarked upon jointly in order to check further economic deterioration and even, if possible, reverse the negative trends of recent years. The essential purpose would be to agree upon a programme of action after fostering a broad debate within each government and at the subregional level.

## 1. Introduction

Central America is passing through a profound crisis in both the economic and the political and social spheres: areas so closely interlinked that it would be idle to try to determine whether one took causal precedence over the other. The fact is that since the beginning of the 1980s the region has been simultaneously sunk into the deepest economic depression and racked by the most serious political upheavals of the last fifty years, so that it is living through a climate of instability and confusion. It is hard to find viable solutions on the political, economic or social level.

The origin, scope and possible consequences of the crisis cannot be understood without analysing the main features of the evolution of the economies and societies of Central America since the war. The first aspect which strikes one is the dynamic growth achieved over a 30-year period -naturally with differences from one country to another- within an atmosphere of financial and monetary stability. A second striking aspect is the decisive influence of external factors, which have been essential determinants not only of economic behaviour, but also of the mutual influence of many political factors. Here lie the historical roots of the repeated propensity of Central Americans to seek abroad the explanations and solutions for the problems affecting them. Furthermore, the fragmentation of Central America since the short-lived federation broke up has also contributed to the fact that each of the countries has resigned itself historically to having a scanty margin of action with regard to its own fate, due to the preponderance of factors beyond its control.

A third noteworthy feature is that, in the thirty years since the end of the Second World War, most of the considerable changes undergone by the economies of the region have been simply juxtaposed to the economic and social structure which already existed before, without bringing about any essential changes in a process referred to in the present study as "superimposed development".

Finally, the fruits of the long period of economic expansion which took place after the war were distributed in a flagrantly inequitable manner between the different strata of the population within the framework of a concentrative -or at least exclusive- process, thus preventing any significant relief of the extreme poverty which persists in the region.

/In addition

In addition to the foregoing constant factors, mention must be made of more recent phenomena of internal and external origin which could well mark a break with the previous development model and forms of political interaction. Thus, there are new challenges to the development of the Central American economies and perils for political coexistence at the national and even the regional levels which affect all the inhabitants of the area. The crisis could itself give rise to opportunities for improving the situation, however, if innovative responses to the economic and social problems of the subregion materialize.

In the following pages, the features of the period after the war are first analysed, followed by an examination of more recent phenomena. Consideration is then given to the short-term prospects and to a number of possibilities for at least reducing the negative effects of the crisis or even seeking to reverse them within the framework of a development model different from that which prevailed in the past.

## 2. Main features of the style of development prevailing in Central America after the war

### a) Economic growth

The first feature of the development of the Central American countries during the last three decades was undoubtedly its sustained dynamism. The gross domestic product of the subregion as a whole grew at the rate of 5.3% per year in real terms between 1950 and 1978, although of course there were differences of degree between the various countries, with the highest rates corresponding to Nicaragua and Costa Rica and the lowest to Honduras. As a result, the per capita real income practically doubled during this period. Even between 1970 and 1978, when the subregion had to face particularly severe problems -the rise in hydrocarbon prices, imbalances in the international financial market, shortages of raw materials and of some foodstuffs in 1974-1975, various droughts and three large-scale natural disasters- the real growth rate exceeded 5.6% per year.

Some other features of this growth may also be noted (see figure 1). First of all, during the 28 years in question negative growth rates were recorded only on a very few occasions, almost always associated with some natural disaster (twice in Honduras and once in Nicaragua and Costa Rica). Secondly, while there were frequent cyclical fluctuations -almost annually- these took place against a background of notably stable growth. The cyclical droughts were only brief, and only exceptionally did the product fall for two years running in any of the countries. Finally, the cyclical evolution of the gross domestic product of the five countries showed great similarity, reflecting both their common form of insertion into the international economy and the high degree of economic interdependence achieved through the integration agreements of the 1950s and 1960s.

The most dynamic sector was generally manufacturing, propelled by the expanded market and industrial development policies created as part of the integration process. As a result, the degree of industrialization of the subregion rose from 12.3% in 1960 to 16.8% in 1978.

### b) The decisive influence of the external sector

The sustained manner in which the Central American economies grew largely reflected the long boom in the international economy which followed the Second World War. During that period, the industrialized countries grew at a cumulative annual rate of 5.0%, while the volume of world trade expanded at the rate of 9.0%.

Figure 1

CENTRAL AMERICA: EVOLUTION OF GROWTH RATES OF GDP

Albeit in different degrees, all the countries of the subregion managed to take advantage of this situation: the value of their exports of goods and services to countries outside the subregion increased by a factor of thirteen between 1950 and 1978, rising from US\$ 250 million to US\$ 3 200 million, while the export sector diversified significantly, both as regards the composition of its products and their geographical destination.<sup>2/</sup> The boom in the traditional export sector also created sufficiently easy conditions to facilitate the bold decision to adopt mutual free trade in virtually all products originating from the subregion within a space of not more than five years. This was responsible for the intensive industrialization process which eventually became a second source of growth, although this never ceased to depend ultimately on the evolution of the traditional external sector. The easy economic situation referred to, together with the intensive process of modernization in the subregion, also helped to create consumption patterns in certain strata of the population which imitated those of more advanced societies and accentuated demand for imported goods.

During the 1960s and 1970s the external sector of the Central American countries underwent significant changes. The relative importance of foreign trade tended to grow -the export and import coefficients for the subregion as a whole rose from 18.6% and 16.3% respectively in 1950 to 30.4% and 33.6% in 1978-;<sup>3/</sup> the structure of exports and imports changed radically -the former included a growing proportion of non-traditional articles, while within the latter the proportion of intermediate and capital goods increased-; intra-Central American trade grew rapidly until it accounted for a high and growing portion of the total exports of each of the countries, while at the same time also accounting for an increasingly high proportion of their total imports; and movements on the capital account became more and more important as the gap on current transactions tended to widen and new sources of international financing, both public and private, became available. As a result, the servicing of the external debt began to absorb an increasingly large proportion of the foreign exchange generated by exports of goods and services.

Even so, throughout this period of growth, diversification and change in the external relations of the region, the essential feature of those small agricultural export economies persisted: the evolution of the external sector largely explained the global economic behaviour of the economy, while the

/restrictions originating

restrictions originating in that sector marked the limit on the rate of domestic economic activity. A direct relationship is thus observed between the level of exports on the one hand and the rates of economic expansion, capital accumulation, investment, procurement of fiscal revenue, level of employment and import capacity, on the other.

The external financing acted as a shock absorber during periods of contraction, preventing drops in the value of exports from being reflected automatically in a restriction on the capacity to import (and hence on the growth capacity of the economy), and at the same time it also facilitated the process of "superimposed development" referred to below. When weakening of external demand coincided with restrictions on the flow of external financing (which served at least partly to make up for the drop in exports), however, the restrictions originating in the external sector had the effect of inhibiting economic growth and even bringing about a contraction in economic activity in real terms.

The influence of external factors on events in the countries of the subregion was not limited to the economic sphere. Some of the consequences of Central America's dependence on exports profoundly affected the shaping of its societies and the political order prevailing in them. It is well known, for example, that the cultivation of one or two basic export products had a decisive influence in fixing the division of labour, because of the intensive and seasonal nature of labour requirements for such crops. The availability of labour has thus played a vital part in the economic development of the region as well as in defining the dual and interdependent nature of export and subsistence agriculture, and these facts largely explain, in turn, the inequitable income distribution structures.

The organization of the Central American economies around one or two export products profoundly influenced also the "patterns of authority": the symbiotic relation between the dominant economic groups (agricultural exporters and traders) and governments, the legacy of corruption from colonial times, and the repressive methods used historically to ensure the availability of labour have helped to consolidate the authoritarian and non-participative systems characteristic of the periods since the war, which have taken different forms from one country to another, or within a single country at different times (the main exception being Costa Rica).

/Furthermore, factors

Furthermore, factors of external origin have also decisively influenced the political interaction in the countries of the subregion. The virtual hegemony exercised by the United States since the signing of the Clayton-Bulwer treaty in 1850 has found a new expression in the period since the war because of the latent conflict existing between the two main superpowers of the world. This is not the place to go into detail about the role of United States foreign policy in Central America -a topic which has been the subject of many studies in recent years-,<sup>4/</sup> but it is worth stressing the considerable influence which the United States has achieved in the region. It is not a question, of course, of claiming that the United States has an omnipotent role or of insinuating that Central American events depend entirely on the designs of one or the other of the superpowers, since the interaction between the national political actors has its own dynamics, but it may nevertheless be maintained that the United States has shown a capacity for fixing the limits of political interaction in the countries of the region by putting its unbalancing weight on the side of the national actors whose position is closest to the objectives of its own foreign policy.

Of course the preferences of United States policy have not always formed a coherent set of objectives: some administrations have been mainly concerned with security -above all the "containment of communism"- while others have been more interested in gradual orderly change towards more pluralistic and equitable societies. In this respect, United States governments have sometimes supported national actors who advocate orderly and peaceful changes, within the framework of a foreign policy vis-à-vis the Latin American countries which some authors have called "idealistic". This happened, for example, when the United States favoured the heterogeneous alliances which overthrew dictatorships in Guatemala, El Salvador and Honduras in the period following the war, or the governments which promoted changes under the "Alliance for Progress" in the 1960s, as well as the possibly somewhat reluctant support given to the similarly heterogeneous alliance which took power in Nicaragua in 1979. On other occasions, the United States Government has preferred to help national actors who, in its opinion, have the best qualifications for ensuring a minimum of stability in the face of radical challenges to the status quo. The best example of this more "realistic" policy might perhaps be the support given by the United States administration to the forces which overthrew the elected government in Guatemala in 1954.

At all events, when contradictions have arisen in United States foreign policy -as happens fairly often- between the objective of promoting orderly change and that of avoiding threats to security, the United States Government has invariably preferred to support those actors in each country which it has considered most capable of defending its own interests. It is in this way that the governments of that country have managed to fix the geopolitical limits referred to earlier.

c) "Superimposed development"

Of course the economies and societies of the Central American countries are very different from what they were thirty years ago, not only in quantitative aspects -the gross domestic product rose from US\$ 1 950 million to US\$ 7 520 million (at 1970 prices) between 1950 and 1980, while over the same period the population rose from eight million to over 20 million inhabitants- but also because important qualitative changes have taken place. The societies are much more segmented and pluralistic; a noteworthy feature is the appearance of middle-income strata attributable partly to the progressive urbanization (only 16% of the population lived in urban areas in 1950, compared with 43% in 1980); the importance of secondary sector activities in the economies has increased (their relative participation rose from 14.6% to 24.1% between the two periods in question), and in general the system of production has been modernized and diversified year by year. The different geographical regions of the countries are now much better integrated thanks to the heavy investments made in the physical transport and communications infrastructure, and advances have also been made in the supply of education and especially health services. These changes are to be attributed essentially to the "spillover" caused by the style of development which has predominated in all the countries -albeit with specific characteristics from one to another- over the whole period under analysis. It may be considered that these changes have generally speaking been the only ones permitted by those who have had the possibility of keeping changes within certain limits, outstanding among these actors being those who obtained their economic power under the agricultural export pattern which is so vital for this type of historical development in the subregion. Consequently, it may be said that the considerable changes which took place in the three decades since the war

/are characterized

are characterized essentially by the way in which the new economic and social strata were simply juxtaposed with the existing ones within a process of change and modernization which did not threaten in essence the existing economic structure.

The foregoing is simply another way of explaining a process of gradual and peaceful change: as long as the pre-existing structures are not eliminated, then all the changes which take place in patterns of development must, by definition, be of an additive or superimposed nature, although this does not mean that they should necessarily be scorned for this reason.

What it is desired to stress here, however, is that when these changes have seriously threatened the existing structures and vested interests, they have almost invariably encountered their limit, above all when the interests of the dominant groups have been identical - as has frequently, but not always occurred - with those of the main international actor in the Central American political arena in the terms already referred to in previous paragraphs. Thus, peaceful and orderly changes or reforms have had to comply with very tight limits in most of the countries of the region. To put this another way, economic progress has caused an important social change, with many groups rising in the income scale and the formation of middle classes, but the maintenance of this historical pattern of development has given rise to only a slow and halting advance by the political institutions. The gap between the economic changes and the strengthening of the political practices and institutions required by a more complex society have contributed to the background of instability in Central America.

This essential characteristic of "superimposed development" has frequently obliged governments to seek substitutes for changes which perhaps run the risk of exceeding these limits. Thus, for example, recourse was had to external financing partly in order to postpone or take the place of increases in the tax base; State land was distributed in programmes called "colonization" instead of reorganizing land tenure systems, and external saving was used as a substitute (instead of a complement) to the inadequate machinery for tapping national saving.

By the same token, the tax burden came to be an interesting indicator of the limits which "superimposed development" had to face in Central America. Although important changes took place within the taxation system in all the countries - as a reflection of the changes which were taking place in the system

of production- it is curious that the procurement of fiscal resources, as a percentage of the gross domestic product, remained constant in some countries or only grew very slowly in others (see table 1). Furthermore, this coefficient of taxation was extremely low compared with that of other countries of similar economic and social structure, and this circumstance should not be considered a mere accident: organized business circles in all the countries -albeit to different degrees- stubbornly resisted rises in levels of taxation, especially taxation on production and income. The financial restrictions due to the smaller procurement of fiscal revenue severely limited the capacity of the public sector to play a more active role in development, while the modest increases achieved in the coefficient of public expenditure (see table 2) were increasingly financed through greater indebtedness, especially of external origin.

The limited participation of the public sector in the gross domestic product, as measured through the procurement of tax revenue and central government expenditure, also fitted in with the "anti-interventionist" position of the dominant groups in Central American societies. In the 1950s and 1960s, the public sector was gradually taking control of such public services as the generation and distribution of electricity, telephone communications, rail transport and the management of ports, while State activity was also strengthened with the establishment of public development banks and institutions for regulating the prices of basic consumer goods. In all countries, however, the public sector scrupulously avoided participating in activities of interest to private enterprise, the main exception to this rule being the Costa Rican financial intermediation system.

Another example of the persistence of prior structures in these processes of change was the low level of backward or forward integration of traditional agricultural export activities, in the sense that the sectors depending on these have not tried to diversify systematically in order to invest in more complex activities. The appearance of new agricultural export activities (cotton, sugar and beef) was thus limited to repeating the pattern of traditional basic commodities, with their scanty linkages with other productive activities. In other words, the traditional producers diversified only very little, and the State shared only slightly in the surplus generated by them. It will thus readily be understood how the traditional economic and social structures persisted and the

/changes mentioned

changes mentioned were simply juxtaposed with them without succeeding in altering them in essence. Consequently, the changes occurred only within relatively narrow limits (although these varied somewhat from country to country). Thus, despite the considerable expansion and change which took place in the Central American economies and societies in the thirty years following the war, that change was, paradoxically, not sufficient to meet the growing expectations of numerous sectors of the population. Furthermore, the instinctive desire to preserve vulnerable social systems led to the maintenance in most of the countries of the existing economic patterns -which were able to take advantage of the boom in the international economy- based on political institutions which were of an exclusive nature, at least as regards the distribution of power and of the fruits of economic development. Consequently, the social mobilization and expansion which accompanied the postwar boom were not able to offset the backwardness of some political structures.

d) The exclusive nature of development

As a result of this, despite their economic dynamism the countries of the subregion were not capable during the thirty years after the war of significantly improving income distribution or of reducing the number of Central Americans living in a state of extreme poverty. According to household surveys carried out in recent years, the poorest 20% of the population shares less than 4% of the national income, while at the other extreme the richest 20% of the population shares more than 55%. There are considerable differences from one country to another, the most dissimilar features corresponding once again to Costa Rica (see table 3). In countries where surveys were carried out at different times, although the methodologies used were not always comparable, the available evidence indicates that the gap between the groups at the two extremes of the scale widened, even though the relative share of the intermediate strata may have tended to increase (see table 4). In the case of Guatemala and Costa Rica, the per capita real income of the poorest 20% of the population actually went down.

In absolute figures, out of a total of over 20 million Central Americans in 1980, some 13.2 million (64%) were living in a state of poverty -in the sense that their income did not cover their basic needs- while over 8.5 million (41%) did not even have sufficient income to cover the value of the minimum shopping basket of food considered necessary in order to meet their biological nutritional needs (see table 5). The situation was much more serious in rural areas than in

urban areas, although there were considerable differences from one country to another (in Costa Rica, less than 25% of the population lived in poverty, whereas in Guatemala the proportion was over 70%). Moreover, although it is very likely that the percentage of Central Americans living in a state of poverty nowadays is less than it was 30 years ago, it is nevertheless true that in absolute terms, because of population expansion, there are now more poor people (and also more people who are not poor) than in the period immediately after the Second World War.

In short, the characteristic style of development of the region has been concentrative, or at any rate of an exclusive nature in the sense that it has favoured the different strata of the population in a flagrantly inequitable manner, accentuating the degree of income concentration in some countries. Likewise, although 30 years of rapid and sustained economic expansion have gone by, over half the population of Central America -and three-quarters of those living in rural areas- do not have sufficient income to cover their essential needs as regards food, housing, clothing and basic services.

It should be noted that the exclusive pattern of development is not limited to the economic and social sphere. If it were possible to speak of a truly typical characteristic of political interaction in most of the Central American countries, then this characteristic would be the absence of broad popular participation, reflected in the virtual exclusion of the masses, and especially the rural masses, from political activity. Neither the industrialization nor the urbanization which have taken place since the end of the war have been able to bring about a decisive change in the still essentially agricultural nature of these societies. With a few exceptions, the masses working in rural areas continue to be passive observers instead of organized actors in the evolution of the political systems. This exclusive feature has had a decisive influence both on the characteristics and the scope of the various modernization projects attempted in the subregion.

Thus, with a few exceptions, the lack of effective participation on the part of the emerging social classes meant that they were not in a position to

/counterbalance the

counterbalance the weight of the traditional power groups in the handling of public affairs, and this sometimes further increased the tensions between the rapid social development and the slow institutional development in the political sphere.

To put this in another way, except in the case of Costa Rica the political interaction in Central America has generally been of an elitist nature and it has not been able to include the most numerous population groups of the subregion in the projects for the modernization of its societies. To do this would have meant perhaps the elimination, although possibly only gradually, of the factors of authoritarianism already referred to, and it would have been necessary to undertake the consistently postponed reforms aimed at fulfilling the legitimate aspirations of the groups which have so far been virtually excluded from the benefits of development.

### 3. Recent events and the current economic crisis

#### a) The break with historical trends

In 1977-1978 the trends briefly described above reached a turning point, at least as regards sustained economic growth. Since that two-year period, a progressive slowdown has occurred which ultimately led to negative rates in all the countries (1982) (see figure 1). The duration, intensity and peculiar characteristics of this situation have no precedent in the period since the war. Suffice it to say that, after 30 years of expansion in the five countries' per capita income (with only sporadic interruptions), there has been a sharp and pervasive decrease during the last five years. In Costa Rica, Guatemala and Honduras the absolute level in late 1982 barely equalled that of 1976. In El Salvador and Nicaragua the situation was even more dramatic, since real per capita income had slipped to the levels of the first half of the 1960s.

In addition, the process of economic integration, which had earlier allowed the downward fluctuations in the international economy to be offset, changed direction and became a factor which magnified the crisis. Due to the depth of the crisis, together with the political conditions and the lack of a strategy of subregional scope, the economic interdependence of the five countries has tended to become a mechanism which transmits recessionary economic forces.

The fact that the pronounced deterioration in the evolution of the economies has coincided with a period of increasing political upheaval may be functionally related to some of the characteristics of Central American societies which were mentioned previously. Some of the many manifestations of those characteristics led to a questioning of the social order which involved violent challenges to the status quo, and these, in turn, gave rise to violent responses which contributed to a rapid polarization of positions in some countries, especially Guatemala, El Salvador and Nicaragua. There are many complex and mutually-reinforcing interrelationships among the local political and economic factors and the way in which both intermix with external influences. These phenomena will be briefly examined below.

#### b) The impact of exogenous phenomena

It is no coincidence that the economic crisis has affected all of the countries, regardless of the extent of the social peace or upheaval prevailing in them, the economic policy objectives pursued, or the different relations

/between the

between the public and private sectors. All have been seriously affected by factors of external origin. This has been inevitable because the common denominator affecting all the countries has been the deep recession in the international economy which, as already noted, to a great extent determines the overall behaviour of the Central American economies and even imposes a limit upon their ability to grow. Now, in addition to the world recession, the economic effects of the political crisis -discouragement of private investment, flight of capital, difficulties in attracting external financing- have combined and have reinforced one another to the point where they have produced an economic breakdown unlike any seen in Central America since the 1930s.

With respect to the effects of the disarray in the international economy, it may be recalled that, in addition to the industrialized countries' difficulties in 1978-1979 -low growth rates, high rates of inflation, decreased savings, lags in the application of technological innovations- hydrocarbon prices were increased again in 1979. Still greater importance could perhaps be attributed to the attempts to modify economic policy made by some industrialized countries which have stressed the fight against inflation -with some success- and have resorted, inter alia, to restrictive monetary measures that have resulted in high interest rates. These policies have undoubtedly contributed to the slowdown of economic activity in the countries where they have been implemented, as well as in the world economy in general, with the resulting impact on the levels of international trade. This situation has weakened the demand for the Central American countries' traditional exports. Given the persistent international inflation (although recently it has begun to decline), the weakness of demand produces a marked deterioration in the terms of trade. An additional factor is that, in the financial sphere, the Central American countries have been adversely affected by the high interest rates on their massive foreign debt and by their recent difficulties in gaining access to new external financing.

The figures in tables 6 and 7 speak for themselves. With the decline in the prices of virtually all the products exported by Central America and the continued upward pressure on the prices of its imports -especially hydrocarbons in 1979-1980-5/ the subregion's terms of trade have deteriorated by almost 50% since 1977, while the purchasing power of its exports has fallen by 30%. general terms, the foregoing means that if the 1977 purchasing power of exports had been sustained, the total value of exports in 1982 would have been 40% greater than it was, which would have added approximately 2.0% to the gross domestic product in the latter year.

Since 1978, the terms of trade have gone down each year in all of the countries. In addition, there has been a decline in the volume of the exports of some countries (including product lines, such as nickel in Guatemala, which have ceased to be exported because of lack of demand) as well as increasing difficulties in incorporating new lines of products into external sales due to the market restrictions and protectionist measures which some industrialized countries have put into effect and a considerable decrease in the exportation of some services such as tourism, due not only to the world economic recession but also to non-economic factors in Central America.

On the other hand, productive activity in the Central American countries required imports, in spite of the recession, especially in order to meet the demand created by the increased public spending which was promoted by the governments, partly in order to counteract the sluggishness of private investment. As a result, the trade deficit of the five countries went from US\$ 432 million in 1977 (equal to 2% of the GDP) to more than US\$ 1 400 million in 1981 (6.8% of the GDP) (see table 8). There was also a spectacular increase in the debt service, attributable not only to increased borrowing but also, and in particular, to soaring interest rates. External factor payments rose, for example, from US\$ 268 million in 1977 to US\$ 700 million in 1981 for the subregion as a whole. This accounts for the fact that the current account deficit grew from US\$ 573 million to almost US\$ 2 000 million during the same period (3.8% and 9.5% of the GDP, respectively) (see table 9).

During 1979-1980 Central America had considerable access to public and especially private international financing. The external support for Nicaragua's reconstruction programmes contributed significantly to this phenomenon, and these resources partially replaced internal savings, which tended to be depleted rapidly due to public sector deficits and the flight of private capital. In 1977 only 13.0% of total savings came from external sources, but that figure had increased to 46.4% in 1981 (see table 10). During the same period, the subregion's external public debt grew from US\$ 2 400 million to US\$ 7 700 million, and limitations on several countries' capacity for additional borrowing became obvious.

a/ Preliminary figures.

This last circumstance, combined with the constraints on the availability of new resources (the commercial banking system considers the subregion to be a high financial and political risk, while official sources have tended to diminish due to the austerity policies of the donor countries), has created serious difficulties since 1981 in obtaining net financing, and in 1982 external savings -far from offsetting the drop in national savings- contributed to the trend.

In 1980-1981 the level of economic activity in the subregion would have been even lower if it had not been for public and private net external financing (this rose from US\$ 864 million to US\$ 1 728 million between 1977 and 1980) and if some countries had not used the international monetary reserves which they still had available. Nevertheless, this latter source was quickly exhausted, and by the third quarter of 1982 all the countries, without exception, had negative net reserves.

There was also an intense and persistent flight of capital throughout the subregion (in some countries more than others) due to economic and especially non-economic factors which aggravated each country's external position and thus had a decisive influence in the sharp decline of economic activity.

Furthermore, exogenous factors not only had an impact on the evolution of the economies, they also influenced political events. As noted below, significant changes occurred toward the end of the 1970s in the political interaction of the subregion, especially in Nicaragua. Just as the long period of postwar economic expansion had reached a turning point, the social and political structures too had to undergo a major shift. These events gave rise to a heterogenous alliance which challenged the ruling régime in Nicaragua. It was no coincidence, however, that the changes in Nicaragua -like those in Guatemala, El Salvador and Honduras in the 1940s- occurred at the same time that United States foreign policy was aimed at promoting orderly change based on principles which that country values. Thus, during a brief interlude the geopolitical boundaries referred to earlier were extended, and the challenge launched in one of the countries against the traditional development model became viable.

c) The challenge to the "superimposed development" model

The programme adopted by the Government of National Reconstruction of Nicaragua deviates from the traditional norms. In a different context, the events in El Salvador also deviate from the model of "superimposed development",

/since they

since they have led to changes which, in one form or another, alter the pre-existing structures. It could even be said that, under the twofold onslaught of the economic crisis and the threat to the status quo, it is unlikely that the pre-existing structures in some countries will be able to survive without fundamental adjustments. This in no way predetermines the nature of the social organizations which might eventually replace the preceding ones, nor their ideological leanings; it only means that the postwar model which has been in effect for more than 30 years may have run its course.

Some of the economic phenomena which are the object and the subject of the crisis clearly illustrate the above. One such phenomenon is capital accumulation. Investment has been shrinking considerably since 1978 both as a result and as a cause of the reduction in economic activity, the drop in domestic savings, the flight of capital and the reaction of the private sector to the political and social tensions affecting the subregion. Table 10 shows that the domestic savings of the five countries fell from 19.9% to 9.3% of the gross domestic product in 1981—a serious situation for countries which are attempting to develop. Private investment also suffered a marked reverse; it diminished in all of the countries. The subregional coefficient of private investment diminished from 14% in 1978 to less than 9% in 1981, while in the countries experiencing civil unrest, the coefficient of private capital formation has fallen by 50% in the last five years. The public sector made an effort to counteract that decrease—thereby accentuating another long-standing imbalance in the Central American economies: the public finance deficit—but it was not enough; the coefficient of total investment declined in all the countries and tended to create bottlenecks in areas where public spending cannot substitute for private investment.

The deliberate efforts made by governments to counteract the reduction in economic activity, at a time when there was a downward trend in tax revenues, caused the portion of the subregional GDP represented by public spending to increase from 17.7% in 1977 to 21.3% in 1981, while the taxation rate decreased from 12.9% to 11.6% during the same period. As a result of the asymmetry in the patterns of expenditure and income, the aggregate deficit of the five governments increased from 460 million Central American pesos in 1977 (3% of the GDP) to more than 1 600 million pesos in 1981 (7.8% of the GDP) (see table 11). Given the lack of sufficient external financing to cover the deficits, domestic financing

a/ Preliminary figures.

was used, but this expedient indirectly exacerbated the disequilibrium in the balance of payments -through the imported component of expenditure- and, in some cases, absorbed most of the expansion in domestic credit, thereby taking away resources from the private national sectors. Thus forces came into play which are tending to destroy, or already have destroyed, the traditional stability of prices in the countries of the subregion. This is another manifestation of the gradual functional impoverishment of the pre-existing structures.

d) The consequences for intra-Central American co-operation

The constraints of the external sector -reflected in the shortage of foreign exchange- have worsened to such an extent that, as from 1981, the countries with deficits in intra-regional trade have even had difficulties in covering their debit balances. At first, the central banks of the surplus countries extended bilateral lines of credit, and later a subregional mechanism was established to deal with the same problem multilaterally (the Central American Common Market Fund). However, when these avenues were exhausted <sup>6/</sup> -and when sufficient backing from the international community was not forthcoming- the lack of foreign exchange began to limit intra-Central American trade.

The response of some countries to the constraints on their external sector was to adopt exchange measures (variations in parity, adoption of multiple rates or of controls on the movement of foreign exchange) which affected the terms of trade at the inter-Central American level and, in some cases, limited the volume of commercial transactions. As a result of all these phenomena, intra-regional trade ceased to play its traditional role as a factor capable of offsetting cyclical lows in extraregional trade and became one more victim of the crisis in the external sector. Thus, in 1982 it was estimated that the value of this trade would diminish by almost 20% (from 925 million Central American pesos in 1981 to 750 million pesos in 1982) and that its relative share of the subregion's total exports would shrink from 21.1% to 19.3%.

One of this situation's innumerable effects on the productive apparatus was that the degree of industrialization (which, as already noted, had increased consistently between 1950 and 1978) stagnated, diminishing from 17.1% in 1978 to 16.2% in 1982. In other words, industrialization, whose expansion had been more dynamic than that of the economy as a whole during the boom, has turned out to be less dynamic than the economy as a whole during the recession.

/Despite the

Despite the fact that the Central American governments have traditionally been, and continue to be, successful in keeping the sphere of economic co-operation separate from the sphere of political relations, the growing ideological heterogeneity now poses a latent threat that political differences will overflow into the sphere of economic co-operation precisely at the time when intra-regional co-operation is most needed in order to mitigate the effects of the external sector problems. In addition, the danger of the internationalization of intra-regional conflicts could lead to a greater fragmentation of the Central American Isthmus and a repetition of painful historical episodes.

e) Summary

In short, the subregion is experiencing a critical situation of unprecedented magnitude and depth. Economic activity has been diminishing, and this has been accompanied by growing external imbalances as well as by a sharp downturn in the levels of public sector saving and investment, together with a smaller and smaller radius of action for overcoming these imbalances.

The high and rising levels of open unemployment and underemployment suggest that the long-standing inequalities of the Central American economies will tend to worsen. The prolonged depression and the limited capacity of some of the countries for external borrowing have required the adoption of adjustment programmes -some in accordance with commitments to the International Monetary Fund- which involve the adoption of unpopular economic policies.

The subregion is experiencing an intense political upheaval which is closely related to the above-mentioned economic phenomena, all of which may be the prelude to a breakdown of "superimposed development" at a time when it is still not possible to glimpse the features of any alternative model of development. Moreover, given the unpromising economic prospects already described, not even the most optimistic of men would feel encouraged to embark on social transformations, yet without them the political stability of various countries in the subregion is in danger.

The intensity of the crisis has given rise to an atmosphere of demoralization which we do not know how to approach or overcome. Unanswered questions, and even bewilderment, arise out of the realization that many problems surpass the constituted governments' capacity for action and are beginning to erode the very foundations of the process of Central American integration.

#### 4. Short-term prospects

a) Alternative scenarios and the need to adapt the Central American style of development to the new circumstances

If the international economy had retained the characteristics which it had had at the end of the Second World War, there can be little doubt that for economies with small markets such as those of Central America, the best and perhaps only way of increasing the levels of well-being of their population would have been to seek their dynamic incorporation into external trade flows, although not necessarily in the same forms as in the past.

In effect, because of the scale and characteristics of the markets of the Central American countries -even when considered together- there can be no doubt that, regardless of whatever set of economic policies may be adopted in each country to stimulate its own economy and promote more equitable distribution of the fruits of development, external demand would have to continue playing a decisive role in determining levels of production, while imports from the exterior would play an equally vital function in supplying the region. In other words, regardless of the style of development which each country might select, it would be absurd to think of any possibility of Central American development outside the flows of international trade.

It would be equally mistaken, however, to place all the hopes of the subregion in a development strategy oriented towards external markets whose evolution depends on many imponderable factors. At the very least, it must be taken into account that the industrialized economies -and the international economy in general- may have to make far-reaching structural changes whose consequences are impossible to predict. Is the world facing a prolonged period of recession or very slow expansion, with only limited possibilities of reactivating international trade and even with the danger that those trade flows may continue to shrink? Or may it perhaps be possible, in contrast, to achieve rapid and sustained reactivation of the main industrial powers, as some authors maintain, on the basis of highly advanced technological activities such as genetic engineering, microelectronics and robotization? If reactivation of the industrialized economies is achieved on these new technical bases, then what consequences could result from this for the Central American countries, whose capacity of adaptation to the new circumstances is much smaller? In spite of

/the many

the many studies on the topic published recently both in academic circles and by international and intergovernmental organizations, the complex set of factors intervening in the international crisis means that any forecast which is made can only be mere speculation.

It might, however, be assumed as a realistic hypothesis that the prolonged boom period of the industrialized economies in recent decades has reached its turning point, and that the period of adjustment to a new situation whose features are still to be defined must necessarily be relatively long. Furthermore, during this period the developing countries in general and the Central American countries in particular will not be in similar conditions to those which prevailed in recent years. In particular, the possibility of procuring large amounts of external financing is likely to be constrained not only by the limitations associated with the countries' own capacity for indebtedness or for attracting direct investment, but also by the contraction in the availability of public and private international resources as a result of the drop in the surpluses of the oil-exporting countries, the austerity policies which form part of the adjustment process in the industrialized economies, the problems of indebtedness of the developing countries, and the difficulties experienced by the official multilateral bodies in replenishing their capital.

Even if it subsequently happened that the international economic crisis turned out to be a mere depressive cycle -albeit the most serious since the war- followed by a recovery phase (which apparently has already begun in the United States), the positive effects of the latter on the Central American countries could only be very limited during the next two years in view of the considerable burden represented for almost all of them by the accumulated external debt, the depletion of their international monetary reserves, and the profound imbalances -difficult to overcome in the short term- which the recent recession must have caused in their production capacity and social structure.

Nor is it possible to think of an economic reactivation based on the recovery of levels of saving and investment at the domestic level until such time as it is possible to dispel the reigning climate of instability. This, in its turn, calls for significant changes in the pattern of political interaction in most of the Central American countries. As long as the present degree of polarization of political tendencies, which have boiled over into situations of violence, is

/maintained, and

maintained, and until such time as a way is found to improve the real participation of the broad masses in political life, it is difficult to see how it can be possible to restore social stability and thus enable attention to be turned to the achievement of objectives connected with material well-being. It has already been noted that the challenges to the traditional structures in some countries foreshadow a break with the past, but the characteristics of the social order which may emerge in each of the countries as a consequence of the complex phenomena thus described are still far from clear.

Be that as it may, unless the necessary corrective measures are adopted soon, the present situation -which is already critical- will inevitably tend to deteriorate still further, with unforeseeable and even unmanageable consequences. In the economic sphere of each country, it is only possible to foresee at present rising unemployment, a drop in real per capita income, declining levels of saving and investment, and persistent flights of capital. At the subregional economic level, the important advances in intra-Central American co-operation achieved in 30 years of resolute effort could crumble in the face of the dual problem of the shortage of foreign exchange (which has led to the adoption of national measures whose consequences include restrictions on mutual trade) and the tensions arising from the growing internal division of some countries or the likewise growing ideological heterogeneity between them.

In the political sphere, the events of recent times have aroused the interest of the international community and led to an increased presence of external actors on the Central American stage. The entry of new international forces on this stage and the depth of the economic crisis combine to make a potentially explosive mixture. The perilous consequences of the search for external allies on the part of the different actors facing each other in the arena of Central American domestic policy lie in the probable internationalization of national conflicts because the international political system is split down the middle.

In short, the domestic and external, economic and extra-economic circumstances which gave rise to the evolution of the Central American economies and societies in the thirty years after the end of the Second World War are now totally altered.

The Central American governments, both individually and collectively, must obviously do all they can to prevent such unfavourable tendencies from getting the upper hand. Otherwise, the future awaiting the Central American countries -subject to differences of degree between one and another- would be to pass from the relative economic dynamism of the last 30 years to a downward path which would mean a virtual return to the subsistence economy, while the growing political polarization foreshadows an increasing degree of authoritarianism and even the risk of violent conflicts which go beyond the purely national sphere. These future prospects could also witness the ruin of the economic co-operation efforts carried out so enthusiastically in past decades.

b) Requirements of a style of development fitted to the new circumstances

The recognition that we are facing circumstances which are markedly different from those prevailing in the period following the war would constitute the first step for governments in moving towards a qualitatively different policy. In recent years, the international economy has changed from being a reliable source of support for the growth of the countries of the region to a source of instability, and as has happened so many times in the history of Central America, it has marked the limit -and a very strict limit- for the expansion of their economies. The recent changes in the political sphere, for their part, together with the traditional tendency to look abroad for explanations and solutions, constitute new risks, especially for intra-Central American co-operation.

The countries of the subregion should not resign themselves to meekly suffering the consequences of an adverse external environment. What they should do should be rather to seek to expand their room for action with the aim of gaining some degree of autonomy -no matter how modest it may be- without of course sacrificing the possibility of taking advantage of such dynamic impulses as the international economy may continue to generate. The objective pursued, ultimately, should be that Central America keeps on advancing towards greater control of its own destiny, both in the economic and the political fields.

In the first of these fields, it is not a question of proposing utopian solutions such as, for example, trying to partly isolate the countries from the international flows, but neither is it a question of shrugging one's shoulders and passively accepting the cost of adaptation to the uncertain and adverse situation of the international economy. A realistic but more active approach

/would be

would be one whereby the countries, as well as taking advantage of the opportunities offered by the international economy, would seek ways of reducing the vulnerability of their economies through the creation of alternative poles of development and modification of the traditional patterns of consumption and accumulation. In the second of these fields, what would be called for would be an explicit recognition by the Central American governments of the fact that the international circumstances make it necessary to draw a distinction between economic aid proper and aid which may imply the interference of external actors seeking to internationalize national and intra-regional conflicts.

It is not sought here to spell out in detail the characteristics of a Central American development strategy in line with the new economic circumstances. Unfortunately, there are no set economic policy models for tackling the problem of the reduced opportunities in the international economy or the uncertain situation prevailing in each of the economies of Central America and in the region as a whole. A first approximation, however, could be to identify the essential requirements of a more active approach to the adjustment to and compensation for the dominant recessive tendencies. These requirements would come to form part of a development style whose concrete expression, in view of the absence of theoretical solutions, would have to be gradually perfected through successive approximations as a function of the current particular demands of each country.

i) Definition of the structure of production desired. The first requirement in a development style qualitatively different from that prevailing in the past would be to define with some precision the sectoral and subsectoral priorities of an economic policy aimed at the selective reactivation of production. In this respect, the countries of the region could take a pragmatic approach consisting of taking maximum advantage of the possibilities which the international market might continue to offer, while at the same time giving a decided impulse to efficient import substitution. In effect, the subregion taken as a whole represents a sufficiently large resource base for considerably expanding and diversifying the present production capacity without incurring disproportionate costs.

As regards production for external markets, for example, there is no reason why Central America should resign itself to limiting its exports to five or six basic products, since its resource endowment and its geographical location mean that in spite of the uncertain prospects of the international market there are

/obvious possibilities

obvious possibilities for expanding and diversifying sales of a whole range of products derived from the agricultural sector. These include fruit, vegetables, meat, dairy products, marine products and chemical inputs of vegetable origin, all capable of being subjected to increasing degrees of processing. The exploitation of forest resources, too, represents an important potential for some countries. In this respect, the specialized evolution of the manufacturing sector in the Scandinavian countries during the present century could provide some useful lessons for Central America, as could the progress made by some Asian economies in the export of manufactures of high labour density.

In anticipation of the probable tendencies towards industrial redeployment at the international level, the skills of the subregion's labour force should be developed in order to participate, among other possibilities, in the expansion which will characterize the different branches of the electronics industry, both as regards products and as regards the development of systems. All the foregoing would be a complement -not a substitute- for the traditional export activities of which the countries of the subregion have had experience for decades and which will assuredly more than maintain their competitiveness on the world market.

In short, the present limitations on international demand should not lead Central American governments to give up their efforts to increase the generation of foreign exchange through exports; on the contrary, these efforts should be redoubled and new measures should be taken in the fields of fiscal and exchange rate practices and the organization of production and marketing in order to gain access to the markets of third countries.

As regards production for domestic consumption, the highest priority should be given to the supply of food -a branch in which Central America has achieved virtual self-sufficiency in the past and can do so again- and the promotion of relations between agriculture and industry which will make it possible to sustain and guarantee this self-sufficiency and also to generate exportable surpluses. Furthermore, there is still ample potential in the subregion for the substitution of industrial imports on reasonably efficient terms, especially if industry takes advantage of the economies of scale implicit in the subregional market. Among the branches which offer the best prospects are industrial development in connection with agriculture, construction and basic consumption articles.

/In selecting

In selecting the activities to be given support in the economic policy, a criterion of special importance could be that connected with their capacity to generate productive employment, in view of the probable tendencies of labour supply and demand. In this respect, it would be possible to select labour-intensive techniques in the agricultural sector and also to support manufacturing activities of the same nature.

ii) Realism and pragmatism. One of the main problems which arises when formulating an economic policy is the uncertainty which largely stems from factors traditionally outside the control of the governments of the subregion. Reference has already been made to the doubts which exist regarding the future evolution of the international economy, the changes to which the industrialized economies must face up, or the result of the relatively untried policies being implemented in some of the main industrialized countries. It is not yet known what influence these factors could have in the developing countries in general and those of Central America in particular, nor does anyone know what the final outcome of the grave political and social tensions present in some countries of the subregion will be.

The foregoing means that the economic policy of the Central American countries must be designed and applied with flexibility and realism so that it can be progressively adapted and adjusted to changing, unpredictable and basically unprecedented circumstances. Flexibility and effective responses imply some degree of break with the past, because traditionally policies have tended to react passively or with considerable delay to the vicissitudes of the international economy. Today, in view of the risk that what we are facing is not so much a recessive cycle as a structural change in the world economy, it is necessary to build a response capacity which will make it possible to take advantage of even the slightest opportunities and reduce as far as possible the factors limiting the development of the countries of the subregion: aspects which have particularly important implications as regards the conception and rôle corresponding to the State in guiding the future economic evolution of Central America.

In the same line of ideas, the current uncertainty and lack of well-trying solutions mean that a new style of development must adapt itself conceptually to a decidedly pragmatic approach. This is not the moment to be trying out particular economic doctrines, as the recent experience in Latin America has shown so eloquently. One of the results of the disorder reigning in the international

/economy, for

economy, for example, is that it is just as risky to throw the entire weight of economic policy behind a strategy oriented towards more dynamic insertion into world trade as it is to adopt a strategy which prevents a country from taking advantage of the potentialities of such trade. Economic policy must undoubtedly be planned with sufficient flexibility to enable it to be adapted without difficulty to all the changing conditions of external and internal markets.

In a situation of general lack of confidence on the part of some of the main economic agents, it seems completely inappropriate to leave adjustment programmes exclusively at the mercy of the evolution of the international market and the play of the market forces. Thus, for example, in view of the acute shortage of foreign exchange which characterizes all the economies of the subregion, it would be quite unsuitable to depend on the supply and demand of foreign exchange for the fixing of exchange parities, since repressed needs and speculative pressures tend to value "hard" currencies far above what they are really worth. It would be equally foolhardy to depend only on administrative controls and exaggerated centralization in the application of economic policy when dealing with imbalances of an external or internal nature. It must be stressed once again that what is needed is a pragmatic approach which makes it possible to achieve certain objectives and reduce the effects of the crisis on employment.

iii) Austerity. The international depression has been reflected in a number of restrictions attributable to the need to reduce imports and ultimately levels of economic activity. In no way, however, has the resulting austerity had an equal impact on the different strata of the population. The shortage of foreign exchange, the need to increase the mobilization of domestic saving in view of the restrictions on external financing, and the need to satisfy the most basic needs of the population make it necessary to ensure much more selective and careful use of the resources generated by exports and, in general, to follow an impartially strict pattern of expenditure. In short, the new economic circumstances mean that the structures of expenditure and saving must also be adapted to them, and this should be reflected in austerity consumption patterns in both the private and public sectors.

This austerity has a dual aim: to save foreign currency through the reduction of consumption of non-essential goods and services which are either imported or have a high imported content, and to increase the coefficient of saving.

As regards the first of these aspects, the countries of the region must use the foreign exchange they manage to obtain from their exports with the greatest care and the strictest selectivity, and as already noted this will call for important changes in traditional patterns of consumption and features of investment. As regards consumption, governments should discourage the consumption of non-essential goods and services of external origin, while they should take maximum advantage of national and subregional potential for supplying demand. This could result in a lifestyle different from that usually observed in the past, above all in the middle and upper income levels of Central American society. It goes without saying, of course, that one cannot seek to reduce still further the standards of living of the masses who are already living below the poverty line. On the contrary, as stated below, what is required is a redistributive effort which, among other aspects, will give greatest support to the satisfaction of the basic needs of the population.

As regards investment, everything points to the desirability of reviewing the possibilities of using more labour-intensive technologies, not only because of the pressing need to create jobs, but also because of the need to reduce the imported component in new fixed capital.

The foregoing guidelines are of use for all the different types of governments, regardless of the economic policy objectives pursued or the means adopted to achieve them. Some governments will place emphasis on exchange and taxation policy in order to achieve the most effective use of their foreign exchange, others will adopt administrative systems designed to ration the allocation of such resources, while still others will use a combination of mechanisms designed to secure the selective discouragement of imports. In the final analysis, what is needed is to bring about the rational and careful utilization of scarce foreign exchange in order to reduce as far as possible the adverse repercussions caused by the international economic situation.

Improving the selective utilization of the foreign exchange generated by exports means that the governments of the subregion must do all they can to rationalize public expenditure and reorient it towards truly essential activities. The foregoing assumes particular importance because, on the one hand, the persistence of the international crisis and other factors of a domestic nature foreshadow the intensification of social pressures on governments to fulfil their

/responsibilities for

responsibilities for the economic development and well-being of the population, while on the other hand the markedly open nature of the Central American economies imposes strict limits on the deficit financing of public expenditure because of its domestic effects and its repercussions on the balance of payments. In this respect, it will be necessary to suppress luxury or non-essential expenditure and seek to advance above all in the political détente of the region, so as to be able to transfer part of the resources now devoted to military purposes to the promotion of development.

Furthermore, public expenditure itself could help to reduce the external imbalance if, in selecting investments, preference is given to projects which require a high proportion of national or subregional imports. At all events, the public sector will have to increase its procurement of revenue in keeping with its expenditure, in order to prevent financial deficits from contributing to inflationary demand for imported goods.

iv) Efficiency. Another basic requirement of a strategy in keeping with the new circumstances is that it should ensure that growth is based on increases in efficiency and productivity. In the present circumstances, improving efficiency is absolutely essential, both from the macro and microeconomic point of view, in order to increase the multiplier effects of saving and investment, to substitute imports on reasonably competitive terms, or to maintain and expand exports to international markets. It is the duty of the State to improve the efficiency of the services which it provides and to encourage the productivity of enterprises by making reasonable use of fiscal and credit instruments.

A significant increase in efficiency and employment in the subregion can be achieved without having resort to imports of capital goods, simply by making full use of the existing installed capacity. As is well known, there is a considerable amount of idle capacity, above all in almost all branches of manufacturing. There is also an ample margin for considerably increasing the productivity of the area cultivated in the case of most of the agricultural products of the subregion, even those where the countries have had the greatest success with their exports.

v) Defending the minimum requirements of the masses. If it did not prove possible to bring about any significant reduction in extreme poverty even during the 30 years of dynamic expansion of the Central American economies, then it is inevitable that this situation should grow worse as the economic crisis persists,

/since there

since there is a direct interrelation between levels of employment and degrees of poverty. In the last two years, open unemployment and underemployment have increased, and unless some way of avoiding this is found, this tendency will be aggravated in the immediate future.

Unless the State takes clear measures in favour of the masses, the depressive effects of the crisis -and of the austerity policies accompanying it- will tend to have a disproportionately severe impact on these groups, which are the least well organized to defend themselves, and among other consequences this will bring about a widening of the gulf between the governing and the governed.

The spread of absolute poverty is unacceptable from any point of view. It must be understood, however, that a policy aimed at satisfying the basic needs of the masses is hard to implement even in times of rapid economic expansion, and it is still more difficult to achieve at times of severe restrictions, including those affecting the public finances. At all events, reducing poverty is an essential part of the development approach which is needed. Without it, all efforts to overcome the crisis would be meaningless, since the spread of social discontent could make social tensions unmanageable and make it impossible to retain savings, i.e., it would adversely affect the whole process of investment and development. Thus, in economic policy top priority should be given to agricultural and food systems, especially as regards activities which make intensive use of labour. The provision of social-type housing and the supply of health and educational services also call for priority attention.

It is necessary to find some way of satisfying the basic needs of the population which involves a relatively modest imported component, in order to keep in line with the foreign exchange restrictions. At all events, and quite apart from considerations of equity, the political crisis in many countries of Central America has reached a point at which it is absolutely indispensable to restore a minimum of peaceful understanding among the population. If this is not done, then the social instability will inevitably be transformed into economic instability by paralysing, for example, the process of capital formation and leading to a kind of State-dominated expenditure which would be of little help in expanding productive activities.

c) Implications as regards economic policy lines

A style of development which is different from that prevailing for the last three decades would probably have to be rather more inward-looking than the historical model, at least in the next few years. Thus, if the international economy does indeed turn out to suffer from a prolonged period of stagnation or if, even in a recovery phase, it does not give rise to sufficiently dynamic impulses for the Central American countries, it is logical that these countries should place greater emphasis on domestic demand in order to provide these impulses. Emphasis must be placed on the critical importance of co-operative efforts at the subregional level in support of an effort of this type, with a view to overcoming the obstacles of smallness of the market which cannot be solved at the purely national level. At the same time, the gradual restructuring of consumption in a context of austerity and of a policy deliberately aimed at satisfying the most basic needs of the population would reactivate domestic and subregional demand, at least for certain types of goods and services.

There would be no question of having to face a dilemma (which would in any case be completely false) between stimulating domestic demand and possibly foregoing the benefits of a reactivation of external demand. A flexible and selective economic policy would enable the countries to make better use of the incentives of the national and subregional markets, while it would not stand in the way of taking advantage of such opportunities as the international economy might offer.

It has already been noted that there is no set of models which can guarantee the effectiveness of new policies taking account of the requirements mentioned above. In order to achieve success, however, it will be necessary -quite apart from the specific economic policy objectives which each country pursues and the mechanisms adopted in order to achieve them- to encourage saving, promote growth, and defend the basic needs of the masses. In some countries, the fulfilment of such diverse requirements will call for the adoption of reforms which are long overdue, above all in the area of agrarian reform and taxation, and it will mean that every growth strategy must pay marked attention to the satisfaction of the needs of the masses, on the basis of the creation of opportunities for productive employment.

/If the

If the historical growth model were followed, then far from being able to put into practice minimum programmes for the expansion of job opportunities, all that could be expected in Central America would be increasing open unemployment and underemployment. One of the essential aspects of the approach proposed here would therefore be to take the fullest advantage of the most abundant resource in the subregion -its labour- in order to prevent the international recession from being reflected in still greater levels of poverty.

Much has already been written on this subject, and this is not the moment to repeat arguments. It is worth emphasizing, however, that the main criteria which should be followed by economic policy in the coming years should be that regarding its impact on employment, with the precise aim of contributing one of the basic ingredients for a kind of new social consensus to deal with a crisis which is difficult to solve by traditional instruments.

The foregoing guidelines would find more concrete expression in the application of exchange, credit, taxation and public expenditure policies and in the techniques selected to develop investment programmes. At the same time, it should be reiterated that placing emphasis on a more inward-looking approach than that historically followed would not mean that there should be any slackening in efforts to take advantage of such opportunities as external demand might continue to offer. In this respect, the non-reciprocal preferences recently made available by various countries, including the United States of America and to a lesser extent Mexico, might offer new potential worthy of being explored.

Finally, little could be expected from the adoption of the economic policy criteria and guidelines sketched above unless a way out is found from the social and political tensions which have arisen in some of the countries of the subregion. This is an extremely complex problem which does not admit of simple or much less of standardized solutions. It is not desired to enter into any discussion whatever on this subject in the present study, but it must be emphasized that a minimum of stability and peaceful and harmonious coexistence -both within each of the countries and in the subregion as a whole- is a prerequisite for any serious attempt at development and at the reactivation of private investment. A way must therefore be found to make economic, social and political demands give way to a participation model in which these demands are analysed and ordered in open processes of political negotiation so that they can subsequently be incorporated in concrete form in

/government programmes.

government programmes. It will also be necessary for Central Americans to gain the fullest possible control over their own destinies, not only in economic affairs, as already stated, but also in the political sphere and that of international relations.

d) The role of intra-regional co-operation

Beyond any doubt, intra-regional co-operation offers the best possibility for reducing the rigidity of the limits imposed by the external sector on the Central American economies. Today, more than ever, it is necessary to press on with the programme which was begun in Central America nearly 30 years ago and which has left such valuable fruits and experience. It is necessary to do this not only in order to take advantage of the more dynamic impulses which could be expected from domestic demand (understood on a subregional basis), but also in order to face up jointly to certain specific features of the subregion's relations with the rest of the world. This aspect has been dealt with on repeated occasions in the past in ECLA documents, but it acquires fresh interest in the present circumstances.

The aim would be, through intra-Central American co-operation, to increase the scanty room for action available to each of the individual countries of the subregion, in order thus to reduce the effects of the depression of the external sector. In the short term, the only effective way of expanding local demand seems to be that connected with co-operative efforts at the subregional level. There is nothing new about such a procedure, since as long ago as the 1950s it was successfully put into practice in order to overcome the same obstacle, namely, the narrow limits imposed on growth by international demand. Now, however, it would be adopted in a different situation. If it proved possible to increase intra-regional trade to the maximum, this would be fulfilling the requirements of the new style of development mentioned earlier by making more rational use of installed capacity, reducing the influence of the adverse effects of external sector phenomena, increasing efficiency -both for import substitution and for improving competitiveness on international markets- and even taking joint advantage of the opportunities which the international market may continue to offer.

All this is hindered at present by the barriers standing in the way of intra-regional trade. Clearly, it would not be realistic to defend unrestricted free trade which did not take account of the greater or lesser importance of the goods being traded, but it would be desirable at all events to keep restrictions to the

/minimum and

minimum and even to adopt mechanisms to give preference to reciprocal trade over similar trade flows with third countries. Only in this way could optimum use be made of the installed capacity of the subregion, while even perhaps also promoting some new activities based on subregional demand. For this purpose, the countries would need to adopt new procedures for financing the intra-Central American trade debit balances,<sup>6/</sup> to do away with certain restrictions at present resulting from the exchange controls adopted, and, in general terms, to give essentially the same treatment to products originating from any other Central American country as to those produced domestically.

Furthermore, as already noted, regional co-operation is the best way of improving the use made of the opportunities offered by international trade, both in order to increase exports -on the basis, for example, of common marketing systems- and in order to obtain additional external financing for projects and initiatives which are of interest of all. The strengthening of the Central American Bank for Economic Integration and of the machinery available under the Central American Monetary Council are examples of some measures which would give real force to this latter idea.<sup>7/</sup> Another initiative which is highly topical at present is that adopted by the Central American governments in 1981 whereby they propose to approach the international financial community jointly to seek an increase in the transfer of resources to the subregion. It should be remembered that lack of intra-regional co-ordination in such a vital area as external financing not only has a high opportunity cost -if the possibilities for joint mobilization of a flow of resources which could not be obtained through individual negotiations are lost- but also represents a risk for the survival of intra-Central American co-operation. It has been noted that various actors on the international scene seem to be interested in providing co-operation to the Central American countries on a selective basis, with the exclusion of one or more countries from their programmes. This type of external co-operation, rather than uniting the Central American countries around a topic, would tend to separate them.

There would be no question, of course, of seeking to promote instant integration of the economies of the region, since the obstacles standing in the way of such an ambitious initiative are well known. What is sought for would be rather to make integration an effective instrument for helping each country, internally, to adapt itself to the circumstances mentioned earlier. Making

intra-regional co-operation one of the pillars of this effort would simply mean demanding, in the first instance, the preservation of the degree of economic interdependence already reached, while subsequently promoting joint action to correct or relieve common problems.

In this respect, some ideas could be put forward for reactivating intra-regional economic co-operation in the short term on the basis of concrete action in six aspects: a) maintenance of the degree of economic interdependence already reached on the basis of reduction of the barriers erected to intra-regional trade and the adoption of financial machinery to ensure the smooth operation of such trade; b) revision of the Central American common tariff -on the basis of the technical advisory studies already prepared- to support the economic policy guidelines already discussed earlier; c) regional co-ordination of short-term policies such as exchange policies, or those connected with the processes of cyclical adjustment; d) joint activities vis-à-vis the international community, above all in order to increase the mobilization of external finance and improve the access of Central American products to the markets of third countries; e) implementation of joint projects of multinational interest, such as for example the interconnection of electricity systems and co-operation in the exploitation of marine resources, and f) strengthening of the Central American integration institutions so that they can help to carry out the policies in question.

e) The renewed role of the State

In periods of intensive change, when it is necessary to transform styles of growth, modify consumption patterns and defend minimum levels of well-being of the masses, it is essential in modern societies for the State to assume an active and leading role in the orientation of development, because otherwise society would become fragmented or it would be necessary to pay excessively high social costs.

Furthermore, the renewal of the role of the State is indispensable, regardless of differences of political inclination, because of the need to mobilize the population in a participative effort without which development and social stability would be seriously imperilled, quite independently of the scope and objectives of the economic policy which each government may prefer and the greater or lesser priority assigned to that policy. In other words, the need to adapt to new circumstances makes it essential to bring economic policy into line with the

/different demands.

different demands. Likewise, it is the responsibility of the State to help to solve a series of conflicts which are bound to arise when formulating a style of development which is qualitatively different from the historical one.

It may seem an exaggeration to assert the need for the State to assume a more active role in the present critical situation. If we analyse the features of this situation, however, we see that the public sector still has a certain amount of room for action, and this should be utilized not only in order to cushion the negative impact of the crisis, but also in order to orient its effects in a constructive manner. Thus, for example, the shortage of foreign exchange makes it necessary for someone to lay down an order of priorities for the different importing sectors and also to demand that the income received from exports really is devoted to essential imports. It seems natural that this role should be assigned to the Central Banks and the government departments concerned with foreign trade. At all events, the need to rationalize the use of foreign exchange calls for a greater intervention by the State than that which is required in situations of greater normality as regards a country's external relations.

Furthermore, this shortage gives rise to conflicts of interest and consequent pressures on the part of the various importing and exporting groups. The disputes which invariably take place in these situations can only be solved through the arbitration of a higher authority. In this respect, regardless of the combination of exchange, credit or fiscal formulas resorted to in order to face the crisis, the shortage of resources does in fact sharpen the struggle between the various interest groups, thus opening up -due to the fragmentation of demands- a larger space for action which the public sector can use to its advantage.

Another qualitative change in the role played by the public sector derives from its smaller degree of dependence on international trade as a direct source of fiscal revenue. The decisive role historically played by the exporting groups has been reflected in the considerable weight of foreign trade taxes in the public sector income, but this situation will tend to change as the external depression limits the possibilities of exporting and, accordingly, of importing too. As a result, there will be financial problems until new domestic tax sources are found, but at the same time the vulnerability of the State vis-à-vis certain pressure groups will be reduced.

As already noted, nothing said in this study prejudices the degree of intentionality of public action in each country; the role of the "guiding State" is considered to be perfectly compatible with a strong and vigorous private sector. On the other hand, it is desired to emphasize that there is an unavoidable need for the State to assume a more decisive role in order to orient the style of development in the light of certain objectives connected with the vital common objective of overcoming the adverse factors currently predominating in the economies of the region and threatening their social and political stability.

#### Notes

1/ ECLA, Istmo Centroamericano: El carácter de la crisis económica actual, los desafíos que plantea y la cooperación internacional que demanda (E/CEPAL/402/Rev.1), July 1981.

2/ For the region as a whole, the main export product of each country in 1950 contributed 70% of the total foreign exchange generated by exports of goods. This proportion went down by practically half in 1970 (36.1%), thanks to the diversification of the export sector, although it rose again to 45% in 1978 because of the high prices prevailing that year for coffee, which carries a heavy weight in the total value of exports. Furthermore, in 1950 80% of Central America's external trade was carried out with a single country (the United States), but this proportion went down to 35% in 1978.

3/ If mutual trade is excluded from these figures, the export coefficient for the region as a whole evolved as follows: in 1950, 1960 and 1978, respectively, it was 18.5%, 16.7% and 23.5%, while in the same years the coefficient of imports from outside the region was 16.2%, 19.8% and 27.3%, respectively.

4/ While it must be admitted that the reference to a to-and-fro movement between "realism" and "idealism" in the external policy of the United States represents an oversimplified description, it is nevertheless backed up by some profound analyses. See, for example, the description given by Dexter Perkins of cycles of "quietism" and "activism" in The American Approach to Foreign Policy (Cambridge, Mass., Harvard University Press, Revised Edition, 1972), chapter VII, pp. 136-155. In other cases it is backed up by what Stanley Hoffmann describes as the dualism of the United States style of external policy, one of whose manifestations is that of speaking two different languages, neither of them entirely convincing and both difficult to reconcile, the first being the language of power and the second the language of community and harmony. As Hoffmann himself says even more graphically, only a symbolic eagle can easily hold both arrows and an olive branch at the same time (see Gulliver's Troubles or the Setting of American Foreign Policy (New York, McGraw-Hill Book Company for the Council on Foreign Relations, 1968), pp. 177-178). Finally, the alternation between "realism" and "idealism" in external policy is also backed up by Samuel P. Huntington's recent description of the United States political system as having, as one of its essential features, a gap between political ideals and political realities. Huntington recognizes that such a gap exists in all societies, but asserts that the United States is distinguished by the manner in which it approaches this gap:

namely, through four responses which are different but all form part of a "cyclic pattern" which begins with "moralism", which seeks to eliminate it; then falls into "cynicism", through which it tolerates it, moves on to "complacency", which seeks to ignore it, and ends with "hypocrisy", in which it denies such a gap and thus returns to the beginning once again with "moralism". See American Politics: The Promise of Disharmony (Cambridge, Mass., The Belknap Press of Harvard University Press, 1981), pp. 3, 42, 64 and 68.

5/ For the subregion as a whole, the relative share of petroleum in total imports rose from 4.4% in 1970 to 10.7% in 1976, 18.7% in 1980 and 21.6% in 1981.

6/ At the end of December 1982, the debts contracted by the countries in order to keep up their trade in previous months came to over US\$ 240 million: a debt so large that it exhausted the financing capacity both of the countries enjoying a surplus in this trade and of the multilateral mechanisms mentioned.

7/ On this aspect, a concrete proposal has been prepared jointly with the Centre for Latin American Monetary Studies (CEMLA). See ECLA/CEMLA, Integración monetaria y comercio intrarregional en Centroamérica: una propuesta, February 1983.
