PRESENTACION

Los cuadros de este *Boletín* contienen información sobre la población de los veinte países que integran América Latina, por sexo y edad detallada entre 0 y 24 años, en el período 1965-1985, según diferentes alternativas de crecimiento.

En el *cuadro 1*, los valores se derivan de las proyecciones recomendadas por CELADE (alternativa intermedia), publicadas en el *Boletín Demográfico*, año II, N° 4.

Las cifras del *cuadro 2*, se basan en la alternativa alta contemplada en las proyecciones de cada país, de conformidad con los supuestos hechos sobre la evolución futura de la fecundidad.

Los datos del *cuadro 3*, se estimaron utilizando la alternativa baja considerada en las proyecciones de los diferentes países, según las hipótesis de tendencia futura de la fecundidad establecidas.

La suma, por grupos quinquenales de edades, de la población estimada por edades simples no siempre coincide con los valores de las proyecciones originales, a causa de los procedimientos de interpolación utilizados. No obstante, las diferencias son de poca significación (generalmente, del orden de 1 por mil y nunca superiores al 1 por ciento), por lo que no afecta la aplicación práctica de los resultados.

En las Notas Explicativas de este *Boletín* se describe el método utilizado para estimar los datos publicados.

En el próximo *Boletín Demográfico* se presentará nuevamente información sobre la población total, para el período 1920-2000, de los países y territorios que conforman la Región de América Latina. Se incluirán, además, proyecciones de población por sexo y edad para algunos países del Caribe, no considerados anteriormente.

PRESENTATION

The tables of this *Bulletin* contain information on the population of the 20 Latin American countries, by sex and detailed age between 0 and 24 years, in the period 1965-1985, according to different growth alternatives.

Values shown in *Table 1* have been obtained from projections recommended by CELADE (intermediate alternative), published in *Demographic Bulletin* year II, N° 4.

Figures of *Table 2*, are based on the high alternative contemplated in the projections of each country, according to the estimates prepared on the future evolution of fertility.

Data of *Table 3*, were estimated using the low alternative considered in the projections of the different countries, according to the hypotheses on the future trend of fertility.

The addition, by five-year age groups, of the estimated population by simple ages, does not always coincide with the values of the original projections due to the procedures of interpolation employed. However, the differences are of little significance (generally of the order of 1 per thousand and never over 1 per cent), so that the practical application of results is not affected.

The method used to estimate the data published is described in the Explanatory Notes of this *Bulletin*.

Again, the next issue of the *Demographic Bulletin* will give information on the total population, for the period 1920-2000, of the countries and territories of Latin America. It will also include population projections by sex and age for some Caribbean countries, not previously considered.

NOTAS EXPLICATIVAS

70(

Los datos que aparecen en los cuadros de este Boletín corresponden a estimaciones realizadas en CELADE con base en la siguiente información:

a) Población por sexo y grupos quinquenales de edades del año 1985 para cada uno de los países de América Latina, según las diferentes alternativas de crecimiento contempladas en las proyecciones utilizadas por CELADE (alternativas recomendadas, alta y baja).

b) Relaciones de supervivencia por sexo y grupos de edades (${}_5P_{x, x+4}$), correspondientes a los períodos 1965-1970 a 1980-1985 derivadas de las hipótesis únicas de mortalidad de las proyecciones antes mencionadas.

c) Población total por país y sexo, según las tres alternativas de crecimiento antes señaladas, para los años 1965, 1970, 1975, 1980 y 1985.

El método utilizado fue el siguiente:

a) Se dividió la población del año 1985 en edades individuales mediante los multiplicadores de Beers.^{1/}

b) A partir de las relaciones de supervivencia quinquenales antes mencionadas, se calculó el número de individuos de cada grupo quinquenal de edades en la población de la tabla de vida (${}_5L_x$).

c) Con base en las ${}_5L_x$ se encontró el número de años vividos por la población de cada edad individual en el intervalo de un año (${}_1L_x$), utilizando los multiplicadores de Beers^{2/} para el tramo comprendido entre los 10 y 70 años y el método de interpolación de Fracción Continua^{3/} entre 0 y 9 años.

d) A partir de las L_x se calcularon las relaciones de supervivencia quinquenales por edad individual (${}_5P_{x, x+1}$).

e) A la población de 5 años y más de edad del año 1985 se le aplicó las ${}_5P_{x, x+1}$ correspondientes

en forma retrospectiva, obteniéndose la población por edad individual del año 1980. De igual modo y utilizando las ${}_5P_{x, x+1}$ respectivas, se obtuvo la población de los años 1975, 1970 y 1965.

f) La población del grupo 0-4 del año 1985 se redistribuyó por edad individual (debido a que los multiplicadores de Beers no dieron resultados satisfactorios en ese grupo, especialmente en la edad 0). La población de edad 0 se obtuvo extrapolando la tendencia que su proporción en el grupo 0-4 presenta en el período 1965-1980. La población de 1-4 años se obtuvo por diferencia y se desglosó por edades simples, de acuerdo con la distribución relativa de ese grupo del año 1985 calculada inicialmente mediante los multiplicadores de Beers.

g) La población estimada de 0 a 24 años de edad se restó, de la población total disponible de las proyecciones, para cada sexo y año calendario, obteniéndose así la población del grupo de edades 25 y más.

h) Los valores de América Latina y América Central se obtuvieron por simple suma de los datos estimados para los países que integran dichas regiones.

Dado que en el Brasil, Guatemala y Venezuela no siempre se obtuvieron resultados satisfactorios para las edades de 0 a 4 años, fue necesario modificar levemente el método en esos casos.

EXPLANATORY NOTES

)71(

Data appearing in the tables of this *Bulletin* correspond to estimates prepared at CELADE, on the basis of the following information:

a) Population by sex and quinquennial age groups of 1985 for each of the countries of Latin America according to the different alternatives of growth contemplated in the projections used by CELADE (alternatives recommended, high and low).

b) Survival ratios by sex and age groups (${}_5P_{x,x+4}$) corresponding to 1965-1970 and 1980-1985 periods derived from the sole hypothesis of mortality of the above mentioned projections.

c) Total population by country and sex according to the three alternatives of growth mentioned before for 1965, 1970, 1975, 1980 and 1985.

The method used is the following:

a) The population of 1985 was divided into individual ages by means of the Beers multipliers.^{1/}

b) The number of persons, from each quinquennial age groups, present at the Life Table population, ${}_5L_x$, was derived from the quinquennial survival ratios mentioned above.

c) On the basis of ${}_5L_x$, the number of years lived by the population of each individual age in the interval of a year (L_x) was obtained by means of the Beers multipliers^{2/} for the interval between 10 and 70 years and the Method of interpolation of Continued Fraction^{3/} between 0 and 9 years.

d) The quinquennial survival ratios by individual age (${}_5P_{x,x+1}$) were calculated on the basis of L_x .

e) The corresponding ${}_5P_{x,x+1}$ were applied to the population of 5 years and over of 1985 retrospectively, thus obtaining the population by indi-

vidual age of 1980. The population of 1975, 1970, and 1965 was calculated in the same way and using the corresponding ${}_5P_{x,x+1}$.

f) The population of the group 0-4 of 1985 was redistributed by individual age (due to the fact that the Beers multipliers did not produce satisfactory results in that group, especially in age 0). The age population 0 was obtained extrapolating the tendency showed by its proportion in the group 0-4 in the period 1965-1980. The population of 1-4 years was obtained by difference and was taken off by simple ages according to the relative distribution of that group of 1985, initially calculated by means of the Beers multipliers.

g) For each of the calendar year, the population of 25 years and over, by sex, was calculated by subtracting the estimated population 0 to 24 years of age from the total population considered in the projections.

h) The values for Latin and Central America were calculated by simple addition of the estimated data for the countries belonging to those regions.

For Brazil, Guatemala and Venezuela satisfactory results could not be obtained, in some instances, for the ages 0-4. It was necessary, therefore, to introduce in those cases, minor changes in the method.
