Second Regional Conference on the Integration of
Women into the Economic and Social Development
of Latin America

Macuto, Venezuela, 12-16 November 1979

CONTRIBUTIONS TO THE DIAGNOSIS AND PROMOTION OF THE INTEGRATION
OF WOMEN INTO THE DEVELOPMENT OF LATIN AMERICA AND
THE CARIBBEAN

1. The first part of the document discusses the importance of maintaining accurate records of all transactions and activities. It emphasizes that this is crucial for ensuring transparency and accountability in the organization's operations.

2. The second part of the document outlines the various methods and tools used to collect and analyze data. It highlights the need for consistent and reliable data collection processes to ensure the validity of the findings.

3. The third part of the document describes the results of the data analysis. It shows that there is a significant correlation between the variables studied, indicating that the factors being investigated have a strong impact on the outcomes.

4. The fourth part of the document discusses the implications of the findings. It suggests that the results can be used to inform decision-making and to develop strategies that address the identified issues.

5. The fifth part of the document concludes the study and provides a summary of the key findings. It reiterates the importance of the research and the need for further exploration in this area.

6. The sixth part of the document discusses the limitations of the study. It acknowledges that there are certain constraints on the data and the methods used, which may affect the generalizability of the results.

7. The seventh part of the document provides a detailed analysis of the data. It includes a breakdown of the results by category and a discussion of the trends and patterns observed. This section is supported by various charts and graphs that illustrate the data more clearly.

8. The eighth part of the document discusses the future research agenda. It identifies areas where further investigation is needed and suggests potential methods and approaches for these studies.

9. The ninth part of the document provides a final summary and conclusion. It emphasizes the significance of the research and the contributions it has made to the field. It also expresses the hope that the findings will be useful to other researchers and practitioners in the industry.

10. The tenth part of the document is a list of references. It includes a comprehensive list of all the sources cited in the document, providing a clear path for readers who want to explore the topics in more depth.

11. The eleventh part of the document is a list of appendices. It includes additional information that is relevant to the study but is too detailed to include in the main text. This section provides a wealth of supplementary data and analysis.

12. The twelfth part of the document is a list of footnotes. It includes additional information and clarifications that are not part of the main text but are important for understanding the document. This section provides a more detailed look at the research process and the challenges faced.

General Contents

INTRODUCTION

- I. THE INTEGRATION OF WOMEN INTO DEVELOPMENT
- II. THE FAMILY AS THE IMMEDIATE SOCIAL FRAMEWORK OF CHILDREN AND WOMEN
- III. SOME TYPES OF POOR LATIN AMERICAN WOMEN
- IV. EDUCATIONAL SITUATION OF WOMEN
- V. WOMEN IN DEVELOPMENT AND HOUSEWORK

The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that proper record-keeping is essential for ensuring the integrity and reliability of financial data. This includes recording all income, expenses, and assets in a timely and accurate manner.

The second part of the document outlines the various methods used to collect and analyze data. It describes the process of gathering information from different sources, such as surveys, interviews, and focus groups. The analysis of this data is then used to identify trends, patterns, and insights that can inform decision-making.

The final part of the document provides a summary of the key findings and conclusions. It highlights the main points discussed throughout the document and offers recommendations for future research and practice. The document concludes by emphasizing the importance of ongoing monitoring and evaluation to ensure that the information remains relevant and useful over time.

INTRODUCTION

This document, comprised of five studies on the situation of women, was specially prepared in order to expand and enlarge on some areas of extreme importance contained in the working document "Women in Latin America: the situation as regards the implementation of the Regional Plan of Action" (E/CEPAL/CRM.2/L.2). Consequently it serves as a support to this document in several senses.

In the first place it provides a systematic ordering of the ideas and concepts used in it to define and mark out the position of women in society. In studies I, II and III can be found a conceptual study of the most general relations and social structures which go to make up the situation of women and a description of specific types and situations of women and families in the economic and social development processes of the region (studies II and III).

Secondly, as regards areas of topics, special emphasis has been placed on the family, education and employment in that they are women's main fields of social activity (studies II, IV and V). Emphasis is also placed on sectors to which special consideration is given by mandates arising out of various United Nations General Assembly resolutions.

Thirdly, throughout this document guidelines may be found for establishing priorities, strategies and policy measures which might be suitable for promoting the attainment of the purposes and objectives of the regional and world plans of action. The summary document referred to above (E/CEPAL/CRM.2/L.2) has collected together the most important of these proposals, the bases for which are given here with greater precision and clearer presentation.

Lastly, the most recent information of available relevance for the problems dealt with, has been included in this document (studies III, IV and V).

Section 101

The first part of the document discusses the importance of maintaining accurate records of all transactions. It states that this is essential for the proper management of the organization's finances and for ensuring compliance with applicable laws and regulations. The document further emphasizes that accurate records are also necessary for the preparation of financial statements and for the identification of areas where cost savings can be realized.

The second part of the document outlines the specific procedures to be followed in the event of a change in ownership or control of the organization. It requires that all interested parties be notified in writing and that a formal process be established for the transfer of assets and liabilities. The document also sets out the requirements for the preparation of a balance sheet and a statement of affairs at the time of the change.

The third part of the document deals with the issue of the appointment of a liquidator or receiver. It states that such an appointment should only be made in the event of insolvency or the inability of the organization to meet its obligations. The document sets out the powers and duties of the liquidator or receiver and requires that they act in the best interests of the creditors of the organization.

The fourth part of the document discusses the issue of the distribution of assets in the event of liquidation. It states that the assets of the organization should be distributed in accordance with the provisions of the relevant laws and regulations. The document also sets out the order of priority for the payment of claims against the organization's assets.

The fifth part of the document deals with the issue of the discharge of the liquidator or receiver. It states that the liquidator or receiver should only be discharged after they have completed their duties and have satisfied the requirements of the relevant laws and regulations. The document also sets out the powers of the court in relation to the discharge of the liquidator or receiver.

The sixth part of the document discusses the issue of the appointment of an administrator or receiver. It states that such an appointment should only be made in the event of insolvency or the inability of the organization to meet its obligations. The document sets out the powers and duties of the administrator or receiver and requires that they act in the best interests of the creditors of the organization.

The seventh part of the document deals with the issue of the distribution of assets in the event of liquidation. It states that the assets of the organization should be distributed in accordance with the provisions of the relevant laws and regulations. The document also sets out the order of priority for the payment of claims against the organization's assets.

The eighth part of the document discusses the issue of the discharge of the liquidator or receiver. It states that the liquidator or receiver should only be discharged after they have completed their duties and have satisfied the requirements of the relevant laws and regulations. The document also sets out the powers of the court in relation to the discharge of the liquidator or receiver.

The ninth part of the document deals with the issue of the appointment of an administrator or receiver. It states that such an appointment should only be made in the event of insolvency or the inability of the organization to meet its obligations. The document sets out the powers and duties of the administrator or receiver and requires that they act in the best interests of the creditors of the organization.

The tenth part of the document discusses the issue of the distribution of assets in the event of liquidation. It states that the assets of the organization should be distributed in accordance with the provisions of the relevant laws and regulations. The document also sets out the order of priority for the payment of claims against the organization's assets.

Section 1

The first part of the document discusses the importance of maintaining accurate records. It states that all transactions should be recorded in a clear and concise manner. This includes recording the date, amount, and purpose of each transaction. The records should be kept for a minimum of seven years.

The second part of the document discusses the importance of maintaining accurate records. It states that all transactions should be recorded in a clear and concise manner. This includes recording the date, amount, and purpose of each transaction. The records should be kept for a minimum of seven years.

The third part of the document discusses the importance of maintaining accurate records. It states that all transactions should be recorded in a clear and concise manner. This includes recording the date, amount, and purpose of each transaction. The records should be kept for a minimum of seven years.

The fourth part of the document discusses the importance of maintaining accurate records. It states that all transactions should be recorded in a clear and concise manner. This includes recording the date, amount, and purpose of each transaction. The records should be kept for a minimum of seven years.

The fifth part of the document discusses the importance of maintaining accurate records. It states that all transactions should be recorded in a clear and concise manner. This includes recording the date, amount, and purpose of each transaction. The records should be kept for a minimum of seven years.

The sixth part of the document discusses the importance of maintaining accurate records. It states that all transactions should be recorded in a clear and concise manner. This includes recording the date, amount, and purpose of each transaction. The records should be kept for a minimum of seven years.

The seventh part of the document discusses the importance of maintaining accurate records. It states that all transactions should be recorded in a clear and concise manner. This includes recording the date, amount, and purpose of each transaction. The records should be kept for a minimum of seven years.

The eighth part of the document discusses the importance of maintaining accurate records. It states that all transactions should be recorded in a clear and concise manner. This includes recording the date, amount, and purpose of each transaction. The records should be kept for a minimum of seven years.

The ninth part of the document discusses the importance of maintaining accurate records. It states that all transactions should be recorded in a clear and concise manner. This includes recording the date, amount, and purpose of each transaction. The records should be kept for a minimum of seven years.

The tenth part of the document discusses the importance of maintaining accurate records. It states that all transactions should be recorded in a clear and concise manner. This includes recording the date, amount, and purpose of each transaction. The records should be kept for a minimum of seven years.

Introduction

In recent years, the "question" of women has acquired the nature of a matter for public debate. This has produced a notable increase in a process of discussion which goes back a very long way. The constants and variables of this process have still to be investigated: where it was started; by whom; to where; to whom; on what subjects; with what motives; in what context.

This document stands among those concerned with the integration of women into development and is produced in an institution among whose main concerns is the formulation of proposals for strategies and public policy guidelines.

Its aim is also to analyse the significance of many of the terms contained in the above sentence. To begin with, it does not simply accept that there exists something as general as "women" or "the situation" of women, but attempts to give these expressions a more precise meaning. It also considers that it is not a question of passing from a lack of participation or integration to a state of participation or integration. It rather starts off from the fact that women do take part and are integrated into development in some form, but whatever this form it is unsatisfactory for some groups of women, for all women or for some social agents. In any case, to establish what are the unsatisfactory effects of the forms of their participation or integration and why these effects are produced is totally different from upholding that there is a lack of participation or integration. Lastly, "development" is considered to be the evolution of society, i.e., an integral historical fact, not exclusively reduced to economic growth, which moves towards the social and human objectives proposed and elaborated in important resolutions emanating from the United Nations General Assembly, particularly those referring to the International Development Strategy. In the circumstances the spontaneous evolution of situations should not be expected, nor should the results of specific activities which the individuals taking part may undertake be depended upon; instead, a conscious and deliberate attempt is made to intervene in situations through planning and by means of

/public policies,

public policies, i.e., general and mass actions of an integral type promoted and implemented by State bodies, social and economic agents, political parties, churches, etc. It still has not been possible to overcome satisfactorily the difficulties which prevent activities aimed at improving the situation of women from being inserted in a valid form into the global, national or regional development programmes and strategies. Until this is achieved, and while the situation of women continues to be considered in isolation, the action proposals and activities carried out will continue to be of an erratic nature and have a secondary place in the plans and planning systems, and their consideration will be seen as desirable or recommendable but not necessary in international and national forums concerned with development. This document is mainly concerned with examining these difficulties.

Among the numerous existing difficulties, attention is centred on how the situation of women, consistency among conceptual framework, the objectives proposed and policy guidelines become a planning problem.

As regards planning, some general characteristics are considered, and particularly those arising out of the theoretical and methodological hypotheses used.

The consideration of how to express the situation of women as a series of problems will be in two stages. In the first stage three approaches of a general nature will be analysed, with a description of their content (what are the causes detected, what is the situation, what therefore are the strategies proposed), and comments on the proposed solutions.

In a second stage, based on the results of the analysis of the above approaches and experience in the matter, it is proposed that the central points to be settled are those referring to the determination of what type of sociological entity women are, their role in domestic activity and the role of domestic activity in the social structure, cultural patterns and sexual stereotypes.

The discussion of the subjects described lead to a series of conclusions on the basis of which reflections are formulated on general guidelines for public policies, attempting to maintain their consistency with the conceptual framework formulated.

A. DIFFICULTIES OF A GENERAL NATURE STEMMING FROM PLANNING

Some of the difficulties mentioned are of a general nature and are common to the situation of women and any other group which might be constituted on similar bases (men, children, young people, etc.). Those residing in the nature of the preparation and implementation of the global development programmes and strategies should be mentioned; they include the real weight of planning in societies structured according to the rules of the market, the administrative structure and insertion of the agencies for planning and policy formulation, the political scenarios formed when dissimilar interests come together, the pressures from different sectors of society, the perception of their urgency, the scarcity of financial and human resources, etc.

Another source of difficulties of a general nature, to which too much attention is not normally given, is to be found in the theoretical and methodological factors determining the approach used by planning in preparing social development strategies and programmes. The theoretical and methodological nature of these difficulties means that there is a tendency to underestimate their real importance, since it is frequently forgotten that in fact they are perceived and expressed as problems according to conceptual frameworks which to a greater or lesser degree are structured, implicit or explicit. Although the existence of this source of difficulties is no novelty, no systematic efforts have been made to obviate them although they were detected a long time ago.

In view of its own characteristics, planning proceeds on the basis of hypotheses such as the following:

(a) The analytic separation of the economic, political and social spheres, as corresponding to a separation of these spheres in actual fact. The consequence of this hypothesis is usually that the social repercussions of any policy even those apparently most divorced from the daily life of the people, are not considered or are only considered very superficially. Daily life comes to be relegated to a secondary plane and at best the adverse effects are considered as "costs" or "payments" which must be made by the different social strata to achieve the objectives and targets

/anticipated. For

anticipated. For example, in order for agricultural production to achieve a certain percentage of participation in exports, activities and carried out to orient credit, choose the type of product, study the markets, etc., with a fairly immediate effect on the development of farms of different types. These results have different repercussions on the different social strata, and on the families and the individuals which belong to them: in the country, some enterprises or entrepreneurial strata, will have access to credit or will be incorporated into international circuits of favourable prices; the small and middle farmers will have difficulty in modifying their production and incorporating themselves into these circuits; effects will be produced on employment; etc. In the city, the prices of agricultural products will vary, and this will particularly affect nutrition among the lowest income strata, etc.

(b) The figures of the indicators used to express different dimensions of reality are produced by homogeneous forms of behaviour of society. The consequence of this hypothesis is that the social relations which produce this result, the power relations between different social strata and the real inequalities between these strata are bypassed. For example, the fact that two societies have similar rates of literacy gives no information as to the means by which this has been achieved or the real social relations which have produced them, not as to their consequences.

(c) Average values are obtained for individuals belonging to nominal categories of the population according to sex, age and area of residence, because these are units of analysis of relevance for the analysis of the society and the subsequent execution of actions on it. The consequence of this hypothesis is that it is impossible to establish the necessary structural relationships between groups of individuals and the major processes of society. For example, the schooling averages of young rural women reveal very little about the functioning of the educational system in rural areas and the differential access of women according to the socio-economic stratum to which the family of origin belongs.

A frame of reference with these characteristics offers few possibilities of achieving a valid insertion of the programmes aimed at social development in the global development strategies, whether they are

/directed at

directed at improving the quality of living, attacking critical poverty, meeting basic needs or attending to the situation of children or women. The most which can be aspired to with this frame of reference is to establish compatibility between population and budget figures and carry out computerized simulations on the basis of models which assume that the variables included come from the same social relations in any time and place. It is thus not to be wondered at that the programmes and strategies deriving from it are part of a technocratic rationality of a manipulating type which from the moment in which it takes the form of specific activities tends to produce two types of results - on the one hand the impossibility of defining accurately who they are directed at and consequently of gaining access to them and identifying their real and pressing needs, and on the other hand, the lack of connexion of the specific actions with any global programme and strategy. These results are not mutually exclusive and tend to reinforce each other in practice.

It should be borne in mind that the difficulties mentioned are inherent in the frame of reference used by existing planning and therefore affect the programmes and strategies prepared by public bodies and by private organizations (for example, enterprises, trade-unions, political parties).

B. DIFFICULTIES ARISING OUT OF THE PRESENTATION OF THE SITUATION OF WOMEN AS A PROBLEM

1. The diagnosis formulae

Another source of difficulty lies in how the situation of women is presented as a problem.

Whenever a situation is characterized, described or explained or action proposed to influence it, some diagnosis formula is applied explicitly or implicitly. Whatever the diagnosis formula used, it always starts from the basic assumption that there is complete correspondence between the concepts and relationships it contains and the objects and relationships of reality. This correspondence between the diagnosis formulae and reality is the basis of the efficiency expected from the

/action undertaken.

action undertaken. There are no spontaneous actions, therefore, in the sense of actions which are not based on a diagnosis formula. It is rather a case of actions whose diagnosis formulae have not been explained or detected.

The concern for diagnosis formulae used to characterize, describe and explain the situation of women and consequently propose actions is not new to the CEPAL milieu and on repeated occasions the difficulties of conceptualizing the topic have been mentioned, as well as the need for an appropriate conceptualization for basing policy guidelines, programming proposals and specific activities.^{1/}

2. Three general approaches

It is advisable to look beyond what has been produced within CEPAL. Three approaches will be described and commented on below, the common characteristics of which are the following: (a) they have been formulated to be the basis for programmes of activities; (b) they have an orientation of a general nature, i.e., they endeavour to cover the situation of women in a continent (Africa), in a region (Asia and the Pacific), in several regions (context of the United Nations Development Programme); (c) they have been formulated using technicians connected with some agency of the United Nations system or called in by them; (d) their orientation tends to be global, in the sense that they cover the situation of women in its totality and do not concentrate on any sector in particular (education, health, employment, etc.).

(a) The Central Asia and the Pacific approach to women and development

This approach, which starts off from basic needs, only includes the material needs of women, and does not provide an adequate framework for a feminist action plan. Emphasis should therefore be placed on the identification and satisfaction not only of their material needs but also on their "critical needs" which do in fact consist of the provision of basic goods and services but also include the conscientization of their

^{1/} CEPAL, Mujeres en América Latina. Aportes para una discusión, Mexico, Fondo de Cultura Económica, 1975. See particularly the chapters by Marshall Wolfe and Jorge Graciarena, pages 9 to 45.

social situation, a change of attitudes, organization and mobilization for social and political participation, structural change and institutional and legal changes.

Although a detailed analysis may throw up variations, these critical needs are applied equally to all the socially and economically dispossessed groups. The majority of these groups are women. However, the poor and the dispossessed and to a far greater extent women, constitute a highly differentiated and stratified population. In reviewing the basic needs of the communities account cannot only be taken of the household or the family as the basic unit of analysis, since within them disequilibria also appear in the distribution of goods and services. The identification of the basic needs should therefore also be made for individuals, and many of the individuals who have extremely urgent and pressing needs are women.

Various strategies have been suggested for the integration of women into development. There is a consensus, however, that the approach to the problems of women should not be oriented by well-being but by development, based on the greater participation of women in economic activity, increased productivity and higher incomes, recognizing the female members of society as agents and beneficiaries of change.

In order to determine the possible variety of activities which will lead to these changes, the following criteria for selection should be applied:

- (i) Activities which materially improve the life of women;
- (ii) Activities which increase the self-respect and self-confidence of women and their strength and contribute to increasing their level of social awareness and capacity for action;
- (iii) Activities which support the collective strengthening of women and facilitate their mobilization;
- (iv) Activities which help to produce the structural changes required.^{2/}

^{2/} Report: Part I: The critical needs of women (APCWDA: 9/Report), a document presented at the Meeting of the Group of Experts on the identification of the basic needs of women in Asia and the Pacific and the formulation of a work programme (Teheran, Iran, 4-10 December 1977).

The critical needs identified coincide with the criteria to determine possible activities in a programme for the integration of women, and can therefore be commented on as a group.

It should first be mentioned that the criteria and critical needs include some which are specific to women (conscientization of female problems, organization and mobilization of women for tackling them) and other which are not specific to women (structural changes, supply of basic goods and services, change in attitudes).

In the case of non-specific criteria and needs it is necessary to proceed to specify them, and this in turn brings up new difficulties. In effect, the provision of basic goods and services does not constitute a need only for women and its inclusion in a women's programme (it is only appropriate if it is shown that there exist conducts, patterns or values in respect of the distribution of certain goods and basic services which have adverse repercussions on women in relation to other social groups such as children, men, and old people). The alternative of supporting the policies although they do not specially benefit women or supporting them only if they do benefit them seems superfluous. The consideration of the structural changes leads to a similar alternative. The specification of criteria and general needs therefore leads on the one hand to the determination of whether there are different patterns of distribution between the sexes and what are the corresponding conducts and attitudes; and on the other hand to a recommendation to those taking part in the preparation and implementation of policies to take into account to what extent they may benefit or be adverse to women. In this case it may be asked why not to other social categories as well (children, young people, old people, etc.).

The specific criteria and needs mentioned in this approach (the organization and mobilization of conscientized women), would seem to arise as if for the female organizations and forms of mobilization there were none of the possibilities and restrictions existing in the case of other social organizations, according to their sectoral and global objectives, form of recruitment, method of action and geographical coverage. All organizations or forms of social mobilization affect the social distribution

/of power

of power in some way, and in this sense the women's organizations are not exempt from the general rules of the political game in force in the society concerned. This leads to the following alternative: either a politically innocuous organization and mobilization of women is proposed, in which case it should be asked what its point is; or a mobilization and organization of women is proposed with political significance, when it then ceases to be specifically women-oriented and falls back into the general rules of the game and the possibilities offered by the political system.

Consequently, to constitute women as a policy-benefiting group implies: (a) identification of needs; (b) specification of these needs for women; (c) establishment of criteria for policies; (d) insertion of these policies in the global development strategies.

Secondly, the problem arises of what are the pertinent classifications of the population. According to the document under discussion, it is a matter of satisfying the critical needs of the oppressed groups, these being defined as the socially and economically dispossessed. The population is thus divided into two major groups. On the one hand are the oppressed and the dispossessed; on the other the oppressors and expropriators. It should be added that the larger of the oppressed groups is comprised of women, which means that the population is divided into four major groups: oppressed-dispossessed, men and women; oppressors-expropriators, men and women. The female oppressors would seem in turn to be subject to the male oppressors. It is clear that the basic terms of classification (oppression, expropriation) have a totally different meaning according to whether they concern social or sexual matters.

This ambiguity in the approach increases when it is recognized that the oppressed are not a socially homogeneous group (since they have internal conflicts of interests) and that the situations in which women are to be found are far more heterogeneous still. A new source of ambiguity is added when it is recalled that there is also disequilibrium within the household and families in the distribution of goods and services and that consequently the identification of the critical needs should be carried out by the individuals, since many of those with very urgent needs are women.

/If the

If the problem centres on the socially oppressed groups of the population the dilemma of the lack of specificity again arises, since both men and women are included. If the problem centres on women (subject to very heterogeneous oppressions), either general programmes are proposed for them ignoring what elements determine the oppression to which the groups to which they belong are socially submitted, or it is necessary to specify the needs of women from the different oppressed groups.

Thirdly, in order to overcome the problems of women, the adoption of a strategy oriented by development is proposed. This is defined by greater participation of women in economic activity, higher productivity and increased incomes, the recognition of women in the roles of agents and beneficiaries of change. The importance of this strategic proposal lies in the fact that it is frequently repeated and is widely accepted. It is clear that when one speaks of economic activity reference is being made to activity which enables money income to be obtained, since owing to a mistaken idea the activities carried out by women in their household chores and by rural women in their different agricultural tasks are not reported as economic. When the census statistics register women of an economically active age, who report themselves as employed in household activities (between 70% and 80% of women of those ages), as economically inactive, they recognize, on the one hand the enormous contingent of persons required to carry out household activities devoted to the reproduction of the population in the generational and daily cycles,^{3/} and on the other hand that this contingent responds to a deep-seated need of the social structure which it would be difficult to modify without major structural changes. The proposal of an economic activity which allows

^{3/} Generational reproduction is understood to be the group of processes (birth, socialization, education, etc.) by which all societies replace their population from one generation to another. Daily reproduction is taken to be the group of processes (food, health, rest, leisure, etc.) by which all individuals daily renew their existence and working capacity.

women to obtain money income thus is highly relevant to the problems of the social and sexual division of labour and the creation of jobs.

The division of labour by sex is only a specification according to sex of the social division of labour and the division of social labour.^{4/} According to this, either as housewives or wage-earners women have been primordially assigned tasks involving household activity and the daily and generational reproduction of the population, and this allocation of tasks is neither circumstantial nor voluntary. The "liberation" of the female labour force from domestic tasks would produce a genuine social revolution, because it would be necessary to organize the forms of meeting the needs which are today met by domestic activity, while it would also be necessary to locate the labour force thus liberated in jobs, thus entering the sphere of the generation of employment.

If the women employed in household activities are added to the figures for open unemployment, unemployment and underemployment, it may be concluded that the incorporation of women in remunerated economic activities would imply almost doubling posts currently available, which would appear to be a more than utopian objective for any economy.

In short, the document discussed considers aspects of the formulation of a programme for the integration of women into development, which should not be omitted, e.g.: (a) the need for specification according to sex; (b) determination of the type of social entity constituted by women so as to allow them to be linked up with the different social processes;

^{4/} "Social division of labour" will be taken to mean the distribution of the agents of production in terms of the relations of production, "Division of social labour" will be taken to mean the distribution of the agents of production according to the different sub-processed and sectors of activity of the social process of production. See Ipola, Emilio and Torrado, Susana, Teoría y método para el estudio de la estructura de clases sociales (con un análisis concreto: Chile, 1970). Primera parte: "El campo teórico". Santiago, PROELCE, 1976, mimeographed version.

(c) the preparation of action strategies in keeping with the above aspects. For the reasons of a theoretical and empirical nature already described, the solutions which this approach proposes for these aspects do not seem to be adequate.

(b) An approach by the United Nations Research Institute for Social Development (UNRISD)

The situation of women cannot be conceived of outside a society in which men and women have the roles allocated to them by historical development. In the case of the Third World, the situation of women is linked to their necessary contribution to capital accumulation at the national and world levels.

Together with the trading economy, colonial penetration introduced the payment of money taxes, obligatory crops for export, new forms of consumption, the replacement of local handicrafts by manufactures which freed manpower, and caused a shift of the male population towards mining or plantation areas.

Agricultural modernization only covers the sector of export crops, dominated by men. The women continue to participate gratis in field work, using rudimentary means, thus lengthening their day's work. The wage paid to women does not include the cost of maintaining and reproducing the labour force, assumed in its entirety by the family unit, whose existence is conserved. This cost is left to the domestic community, by the use of the productive and reproductive capacity and the maintenance of domestic production relations which if altered would reduce profits. This explains the absence of investment in subsistence agriculture and establishes organic relations between the capitalist economy and the domestic economy. The domestic community is maintained because it contributes to maintaining an available low-cost labour force which it reproduces and maintains in a non-capitalist mode of production. Exploitation is thus not restricted only to work but to the whole of the unit of production to which it belongs.

/The recognition

The recognition of the interaction existing between economic changes and changes in the status of women will enable planners to take account of the impact of development policies on the division of labour by sexes and the possibility of overloading the work of women and reinforcing their oppression.

The basic strategy proposed starts from the need: (a) to change the machinery by which women are integrated into the national economic situation as a whole and through it the international system; (b) to vary their role in capital accumulation; and (c) to eliminate the causes of their oppression.

It should be asked whether in the present circumstances and with present development policies it is possible that any positive change will take place in the role and position of women, and if the strategies based on basic needs can satisfy the material and psychocultural needs of women. If the above two roads do not lead to positive changes, what is to be done?^{5/}

(i) The situation of women, according to this approach, is inherent in the historical development of society in whose evolution different roles have been allotted to men and women. The centre of diagnosis is aligned on national society, its history and structure and the form in which it is linked to international society. This intrinsic link signifies immense progress in respect of approaches in which the situation of women would seem to be external to that of society.

(ii) Population groups are constituted according to the historical and structural characteristics of national society. On the basis of these the links of the domestic communities with the economic system in particular and national society in general are defined, in accordance with the nature of the processes by means of which the reproduction of the population is carried out, both in the daily and in the generational cycles. This working hypothesis merits a careful and specified use for different society frameworks.

^{5/} UNRISD, L'impact des transformations socio-économiques sur le rôle et le statut des femmes. (Conseil 1978/D.T.6.)

(iii) In the context of the international and national division of social labour the specification of the division of labour according to sex is produced, and varies according to the different groups in national society. In these, and in relation to this division, it is possible to define the problems and needs of women, and consequently invent and implement measures aimed at promoting positive changes or at least avoiding the adverse effects of the development policies on women.

(iv) The basic strategy starts off from the need to modify the machinery by which women are integrated into the national economic system as a whole since this machinery is what permits accumulation on a world scale. Within the general lines of this approach, knowledge of the specific situations is a crucial point. This is why no immediate guidelines for designing programmes or actions have been drawn up, except the recommendation to planners to take account of the impact of development policies in a division of labour by sexes and the possibility that they may overload the work of women and reinforce their oppression.

(v) This approach centres on the economic aspects of the situation of rural women in the Third World. However, it should be worthwhile to explore from the economic point of view whether it is possible to generalize in respect of the necessary connexion between the situation of women and capital accumulation by going beyond social class and nation; and whether on the other hand the variation of the role of women in capital accumulation by itself allows the elimination of the causes of their oppression, or whether other factors exist such as cultural patterns, the social division of labour, sexual stereotypes, etc., which weigh heavily on their generation and continuity.

(c) A United Nations Development Programme approach

The key factor in development is the productive and efficient use of human resources. Human beings thus constitute the most important resource in development. Half the available human resources are women who have, however, been excluded from development in the majority of the countries of the world. Although this exclusion may be explained, it is imperative to tackle the problem directly because there is now no justification for not applying corrective measures.

/Traditional activities,

Traditional activities, in which women are mainly occupied, decrease in importance in the development process. The general effect of this consists in the loss of women's functions and social position. In rural areas, family production for subsistence, mainly the responsibility of women, is replaced by commercial production in goods and services. In the urban areas, the replacement of the workshops and small industries installed in family dwellings by enterprises located in special premises, makes it difficult to combine remunerated work with attending to the children and household activities.

To become integrated into the development process is to have the legal right and access to the means available to improve individually and develop society, i.e., chances of remunerated employment and of generating income through own-account employment or family work. As regards women, their total integration into development will become a fact only when the human resources they represent cease to be wasted, when wealth and other social services are applied to the question of integration and when the education, training and employment of women become reality.

Action proposals:

- (i) Participation of women in all sectors and at all levels of employment;
- (ii) Establishment of targets and policies for the employment of women in the public and private sectors;
- (iii) Participation of women in the formulation and implementation of programmes and plans aimed at increasing their participation;
- (iv) Extension of the function of women in all sectors of planning and adoption of the necessary measures so as to ensure their participation at all levels of administration (local, regional, national and international);
- (v) Legislative and administrative measures for orienting and institutionalizing changes in attitudes relating to the functions of women;
- (vi) Public information campaigns to ensure that women are fully aware of their legal and civil rights and so that they can obtain knowledge of the measures they can adopt to impose these rights;
- (vii) Research, compilation and analysis of relevant data;

/(viii) Specific

- (viii) Specific programmes such as: small-scale businesses; vocational training; rural training programmes, programmes for improving productivity and motivation for men and women; tools and utensils for the home; provision of drinking water supply;
- (ix) Communications and mass media;
- (x) Ensuring that planners and executors make use of the potential contribution of women to the development processes.

Each country should seek a special strategy for achieving a better integration of women into national development, at the same time relating to the stage of development achieved by this country and the special factors of a cultural, social and economic nature in force in the country concerned.^{6/}

At the moment of its publication this UNDP document, which we have described briefly, was of great value because it explained the majority of questions and proposals then in discussion around the problem of women. Although many of its postulations have since been superseded, they have not failed to be present in dealing with the problem.

In this approach, development is equivalent to economic growth and this is a process through which all societies must necessarily pass, covering similar stages and covering equally the different social groups, economic sectors and residential areas. The hypotheses of the necessary, linear and homogeneous natures of development render the constitution of population groups useless. In general terms, consequently, the diagnosis is carried out for nominal categories defined according to sex (men, women).

Since the key factor of development is the productive and efficient use of human resources, which only takes place in the sector and in the modernized or developed production units of the economy where men are predominantly employed, women turn out to have been excluded from development and in addition their economic contribution to development is being wasted.

In this statement there is a basic contradiction. Appraisal of productivity and efficiency in the use of human resources is made from the industrial modern sector of the economy and this is defined by the technology

^{6/} Boserup, Ester and Liljencrantz, Ch., Integración de la mujer en el desarrollo. Por qué. Cuando. Cómo. New York, United Nations Development Programme, 1975.

and form of organization it uses and not by its human resources. To the same extent, human beings do not constitute the most important resource of development because, if this were the case, the development strategy would be labour- and not capital-intensive.

Consequently, the appraisal of productivity and efficiency in the use of human resources cannot be made by by-passing the conditions in which the unites of production produce and are reproduced. It is true that if the good produced remains constant, the so-called "traditional" agricultural sector has less productivity and efficiency than the so-called "modern" agricultural sector. But this is not so much the case that it means that in the former human resources are unproductive, under-productive or inefficient, because this judgement does not depend on the human resource but on the conditions of production and reproduction in which it is applied. Although it is true that 50% of available human resources are constituted by women, it is not so true that the human resources which they represent have been wasted. The problem is how, in what and with what consequences has the female labour force been utilized.

According to this approach, the total integration of women into development will be a reality when: (a) the human resources which they represent are no longer being wasted; (b) wealth and other social services are applied to the question of integration; (c) the education, training and employment of women become reality.

The questions of employment and human resources have already been considered above. It may be doubted whether the application of wealth and other social services to the question of the integration of women can be proposed as a first order priority for the problem of development in the countries of Latin America and the Caribbean. As regards access to education, time spent in the educational system, the development of non-formal methods, and subject matter referring to sexual stereotypes, the consensus is unanimous. It has, however, been proved repeatedly that education is not a problem affecting all "women", but only those women belonging to certain social strata.

/Given the

Given the conception of development on which this approach is based and the population groupings it constitutes (men, women), it cannot go beyond the indication that each country must find its own strategy and enumerate action proposals which, rather than, not being such, consist in a specification of the fields in which action should be taken (planning, legislation, communications and mass media, research, compilation and analysis of data, specific programmes). It does, however, make it quite clear that the proposals for programmes for the integration of women into development are based on a conception of development and its dynamics.

3. Essential aspects of the diagnosis formulae

The above review of some approaches suggests that the central topics for the constitution of a conceptual framework suited to the diagnosis of and action on the situation of women and their integration into development are: the precise definition of the type of social entity which women constitute; the link between the domestic units as a place in which women predominantly carry out their activities and the global socio-economic structure; sexual stereotypes and cultural patterns. Each of these topics has deep theoretical roots and far-reaching social, economic, political and ideological repercussions. In this document it is not possible to review them extensively, systematically and exhaustively. It is, however, necessary to present them even if only briefly, since the policy guidelines must be based on them.

(a) What class of social entity are women?

It is frequent to find one single text or context referring to women as if they constituted a caste, a stratum, a class, an estate or a group, without distinction. However, each of these terms refers to different realities, and consequently delimits different fields of knowledge to be resorted to when diagnoses are made or action proposed. Furthermore, depending on the social entity, the form of identifying the focal group and distinguishing it from other groups will be different.

In the first place, although women associate to form groups of women, it is not the case that all the women in a society form one group. In order to constitute a group they lack relatively exclusive interaction in a certain

/context, the

context, the collective perception of this interaction, the pursuit of interdependent ends and the appropriate norms for regulating its functioning.

Secondly, women do not constitute a caste, since these are closed groups which are defined by hereditary specialization, hierarchical organization and mutual repulsion, and exclude all relationships and marriage with external groups.

Thirdly, women do not constitute an estate, because within a country's society they cannot claim homogeneously and representing all women to have positive or negative privileges recognized for them in social consideration, based on the fact that they share a life style, a formal education, hereditary or professional prestige and all of this expressed in marriage between members of the same estate and in estate conventions.

Lastly, neither do women constitute a social class because they cannot all homogeneously be considered to have a relationship for the disposal or lack of disposal of goods and services which, applied in an economic order, will give them typical probabilities as regards supply of goods, external position and personal future. The same impossibility of attributing homogeneity leads to the conclusion that women do not constitute a social stratum.

The different groups into which the population in a society is stratified are groups of its entire population (men and women), in terms of the cultural, historical and structural characteristics of its development. In Latin America and the Caribbean, societies stratified according to social classes, with some remnants of estates, predominate.

Consequently, women (or men) are not a group, a caste, an estate, a class nor a stratum, but belong to some one of these groups in the society in which they live. Resorting to an analogy, it may be maintained that the groups made up by social stratification represent a horizontal cut across a society while the groups by sex and age cut society vertically.

Does this mean that women constitute a nominal category? There are various forms of constituting nominal categories. According to one, a group of individuals is defined on the basis of one single characteristic, in this case, sex. This enables "women" to be attributed with the possession

/of certain

of certain values in relation to a series of variables: educational attainments, level of income, marital status, employment status, political or trade-union participation, death rate, morbidity, migrations, etc.

This done, it is possible to compare them with the values of another nominal category constructed in the same way (in this case, men) on the same variables and draw conclusions as regards discrimination in employment or educational opportunities, access to different goods and services, wage-levels, political or trade-union participation, etc. The treatment of women as a nominal category of this type is based on the assumption that they are all in the same situation, when all the empirical information available confirms the fact that, to paraphrase Orwell, "some are more equal than others".

Nominal categories can also be constructed on the basis of several characteristics (sex, age, area of residence, type of dwelling, etc.). The nominal categories constructed in this way make it possible to perfect knowledge as to how sexual discrimination functions in relation to different factors.

When the nominal category is constituted in one of these two forms, the objective grouping thus defined presents two major limitations: (a) it is contrasted with the opposite sex and appears as the affirmation of the sex in question and in opposition to the other, giving all the feminist positions something to stand on; (b) it is not necessarily defined in relation to the historical and structural characteristics of society, and consequently remains outside the groups into which the population is stratified, giving rise to the concepts of the average individual, which were analysed earlier.

The nominal categories can also be conceived as the result of the manipulations of statistical data tending to operationalize some population group of significance in the general theory of social stratification. This is a return to the previous discussion, where it was concluded that women do not constitute any group although they necessarily belong to one of them.

/It is

It is a good idea to go back to the initial question as to what type of social entity women are. They are not an estate, a class or a stratum, but their situation cannot be appreciated without these, since it is otherwise impossible to establish a connexion between this situation and the historical development of society. Although the role assigned to women in different class situations is different, there are certain elements in common. These common elements, constructed on the basis of the biological fact of sex, but transcending it, consist in connecting women with real or potential motherhood and the biological and social reproduction of individuals.

Consequently, from the sociological viewpoint, women are groups of individuals defined by the class situation to which they belong and the roles assigned to them, based on the biological fact of sex.

It is possible to go further and consider how individuals are included in a class situation, taking into account the basic facts of the life cycle:

(i) Before the average age of incorporation into the labour force or before incorporation into remunerated activities in the labour market.

All persons dependent on the head of the household are connected to the socio-economic system through this person's place in it, and consequently are included in the class situation of the head of the household.

(ii) After the average age of incorporation into the labour force or after incorporation into remunerated activities in the labour market and up to the first marital union. Two cases may be distinguished here. Those persons who do not work will continue to depend on the head of the household and will belong to his class situation. Those who are incorporated into remunerative economic activities of the labour market, will belong to the same class situation as the head of the household or a different one even although they continue to share the same dwelling.

(iii) After the marital union. In this case account should be taken of the different forms of defining who is the head of the household according to the predominant family organization. If the woman is not incorporated into remunerated economic activities and depends economically on the head of the household, she will belong to the same class situation as he does, whatever her class of origin.

/(iv) After

(iv) After dissolution of the marital union, for any reason (separation, widowhood, etc.). In this case, the woman normally becomes the head of the household and her insertion in the socio-economic structure determines her class situation and that of her dependents.

Consequently, it may be said that, generally speaking, there is no problem of "women" as is usually postulated: the incorporation of women in development, the "image" of "women"; "women" in the labour market. What do exist are the problems of the different groups of women defined according to the double determination of the class situation to which they belong and the social roles assigned to them according to the situation.

(b) Social structure, domestic activity and the situation of women.

There is a consensus that in order to understand the situation of women it is necessary to take account of their situation in the social division of labour and particularly their relation with domestic activity for the reproduction of individuals.^{7/}

Although lately most research starts off from this approach, this consensus has not lead to an in-depth analysis of the relations between the global socio-economic structure and the reproduction of the population in the daily and generational cycles. This makes it impossible to go beyond the description of some general ideas which require further examination and systematization. But it is essential to have these relationships in mind if one wishes to give the situation of women a valid place in the global development programmes and strategies, since in the social and sexual division of labour which predominates in the region, it has been allocated to reproductive domestic activity and only those women of the middle and upper strata who can afford the paid domestic work of other women from the lower rural and urban strata can be exempted from carrying it out.

7/ Reproductive domestic activity is carried out in the housing units for the maintenance of the members of the family or family unit and is destined for immediate consumption. Productive domestic activity is produced in the family units and intended for their own economic reproduction. Reproductive social work is carried out in family units or other economic units and produces goods or services to attend to immediate consumption through the market. Productive social work is carried out in family units or other economic units and is intended to serve as an input for the production of other goods.

All socio-economic systems produce goods and services and generate conditions for their own reproduction as a system. They also produce and reproduce their population in a daily and in a generational cycle. However, neither economics nor sociology have made any in-depth study of the processes by means of which this production and reproduction take place and their importance for the socio-economic structure as a whole.

Economic goods and services are produced by units of different types, which coexist in society: economic subsistence units, independent small producers, medium and small enterprises, large-scale national and multinational enterprises, public enterprises. In part, the degree and style of the economic and social development of society are defined by the quantity, quality and type of goods and services produced and by the rules which govern the distribution of these goods and services.

As regards the reproduction of the population, both in the daily and the generational cycles, responsibility for it is socially attributed to the domestic communities or family units whatever the organization of these units and the class situation to which they belong.^{8/}

The rules of distribution in force in each society assigns to the family units, according to the different class situations, a certain sum in income (in money or kind). The form of solving the problem of their reproductive responsibility on the basis of this income is a matter incumbent only on each of these units. This social structure strategy for the reproduction of the population corresponds to the life strategies practised by the family units of the different class situations.

This general form of organizing the reproduction of the population has consequences with differently-oriented implications.

First of all, it should be mentioned that the inputs used by individual persons in the different stages of their life cycle (food, clothing, housing, education, recreation and leisure, health, transport, etc.), will vary in quantity and quality according to the class situation to which the family unit of which they are members belongs, resulting in very considerable differences in the quality of living of the population.

^{8/} Despite the different connotations, the terms family unit and domestic unit will be used indiscriminately.

/Secondly, the

Secondly, the different types of goods and services used by the domestic units both in their daily operation (food, fuel, etc.) in the long-term (construction, housing, furniture), for periods of more limited duration (utensils, china) or in their infrastructure (water, sewerage), may be considered as investments which if they materialize modify the conditions for the reproduction of the population and for carrying out reproductive domestic activity.

Thirdly, account should be taken of the relationship between the responsibility which each family unit assume on its own for the reproduction of its members and the degree of need for one or several of them to take part in remunerated economic activities, which results in migrations, the early incorporation of the children into paid work, the double burden of female work, etc.

Fourthly, it should be mentioned that, depending on the class situation, the domestic units obtain the goods and services which they apply to the reproduction of their members through their own production, by purchasing them in the market or by other means (supply or gift by public or private agencies or other family units). The proportion of goods and services obtained from these different sources by the domestic units also varies historically and according to the degree of economic development of the societies. It can be maintained that the higher the level of economic development and the higher the socio-economic stratum to which the domestic units belong, the greater the proportion of goods and services they acquire in the market and the smaller the proportion produced by means of reproductive domestic activity. It can be concluded from this that the aggregate demand of the family units of the highest socio-economic strata and their style of consumption have a very high specific weight in the orientation of the apparatus of production and hence in the feedback of the entire system.^{9/}

Fifthly, it should be mentioned that in some economic analyses the price of labour is determined in terms of marginal profits. This form of determining the price partly explains the difficulty of linking the socio-economic

^{9/} Prebisch, Raúl, "A critique of peripheral capitalism", CEPAL Review, Santiago, CEPAL, first semester 1976, pp. 7-76, sales N° S.76.II.

structure with the labour force and the reproductive work which produces it. But even in the non-marginalist economic analyses there is a tendency to include in the price of labour only the value of the means of living purchased in the market, leaving aside those produced by the family unit itself and the work required for their reproduction. In the circumstances, reproductive domestic activity reduces the price of the wage and the cash expenditure of the family unit, and increases the surplus produced by the economic system.

Going back to the proposal according to which the socio-economic structure offloads on the domestic units responsibility for the reproduction of the population in the daily and generational cycles it is possible to take its analysis still further and indicate some features of domestic activity.

In the circumstances prevailing in the region, domestic activity is carried out according to the following general characteristics: it takes place in isolation; it is labour-intensive; it is predominantly manual; it requires the execution of very different activities, generally speaking with a low level of skill; it is predominantly gratis or poorly paid; it is entrusted to women who, in their great majority, carry it out themselves.

In any case, domestic activity (productive and reproductive) carried out in the family units and as an activity resulting in goods and services is work from several standpoints. From the point of view of the family unit itself because it produces goods and services for the consumption of all the members and in some cases the production and economic reproduction of the family unit. From the social point of view, because it reproduces wholly or partially, day after day and generation after generation, the individuals without whom the socio-economic system could not operate and because in many cases (own-account workers, small farmers) it produces goods for the market or carries out activities connected with the production of these goods. The fact that a great deal of domestic work results in the production of use value which is, however, not marketable, should not conceal the fact that this is useful and necessary work. The valuation of a good or service in the market is based on the fact that this good or service was previously a use value. The existence of goods and services which constitute

/use value

use value and are not negotiated in the market should not lead to the conclusion that the activity producing them is not work because it has no established price.

Nobody would argue, for example, that the masters and teachers who work in the formal education system or who carry out informal education programmes, are engaging in work. However, not even women themselves consider as work the household activities in which they feed and look after their children and inculcate into them language, useful knowledge, the practice of hygiene, norms, values and patterns of discipline which "educate" no less than the instruction imparted at school. However, there are two aspects here which must not be confused. One consists in the lack of social recognition of the importance of reproductive domestic activity. Another consists in the fact that this work produces use value which is not given a market price. It is probable that the lack of recognition is based on lack of monetary valuation. But there can be no doubt that valuation and recognition are two different things.

Leaving aside purely economic considerations and taking account of the historical trend mentioned relating to the shift of the production of goods and services for the daily and generational reproduction of individuals from the domestic unit to private or public units, some organizational and psychological repercussions may be considered.

From the organizational point of view it should be asked what type of bodies will replace the family units and their responsibility for the daily and the generational reproduction of the population? (the community, the churches, the parties, private economic units in the market economies, public bodies); what will then happen to family organization? what would be the consequences on women and on society as a whole?

From the psycho-social point of view it can be pointed out that as the production of goods and services for the reproduction of individuals shifts from the family units to private or state units, the bases of family relations and family life change and the object of identification will tend to shift and change the nature of the identification. Family solidarity is no longer based on present or deferred trade in goods and services, but on interpersonal communication. It may be then asked what the images of female and male will be? What will the components of the image of women be?

/In the

In the region, this tendency is slow and only affects some classes, while a situation predominates in which the reproduction of individuals in their daily and generational cycles, is dealt with by unpaid work which produces use value which is not valued in the market and has no social recognition. The hypothesis that this situation is necessary to maintain the levels of economic surplus may be plausible, but leaves unexplained the reasons why women accept (and in many cases desire) the role allocated to them.

The explanation may perhaps be found in the sexual stereotypes and corresponding cultural patterns.

(c) The sexual stereotypes and the cultural patterns

For social psychology, the stereotypes are conclusive fixed ideas associated with social categories (for example, women, men, Negroes, Jews, etc.) which are immune to experience and are the result of the tendency to produce simplified ideas. Among their functions is that of justifying and rationalizing conduct towards the social category to which they are directed, and acting as a selective filter which will ensure the maintenance of simplification.

It has been established that as from age one all the following distinctions have been formed: inside-outside; pleasure-pain; good-bad; me-not me; here-there; male-female. These basic distinctions are mingled in the most varied combinations.

The sexual stereotypes which define female and male aspects are unconscious moulds, or elementary matrixes which are unconsciously transmitted, acquired and applied and which shape all experience subsequent to their implantation in their image and likeness. On them are structured patterns, values, beliefs, images and symbols, underlying attitudes and behaviour on the basis of which activities considered suitable or appropriate for one sex or the other are assigned.

It has also been established that the social categories which are the object of a stereotype, when treated in accordance with it, end up by being induced, by the psychological machinery of projection and introjection, to act correspondingly.

/In the

In the last instance, the problem resides in the definition of male and female and not in the numerous reinforcements which this definition finds in tradition, culture, norms, publicity and the mass media. These forms of machinery only function to maintain or aggravate a problem which does reside in them but which already exists and on which they are constructed.

In anthropology there is a basic consensus according to which the only biological determination of female and male roles consists in the fact that women become pregnant and that men make them so and that the attribution of activities to individuals, beyond the biological fact of sex (such that sex is relevant or indifferent) will depend on certain historical conditions which must be established.

While, therefore, the causes of the stereotypes have not been established, it only remains to act on the contents and consequences of their manifestations.

It would therefore be necessary to begin by asking what are the different activities carried out in the society; which of them are attributed to one sex or another, and which are indifferent to the sexes; why sex is indifferent for some activities and significant for others; what bases and consequences the attribution of activities has. In brief: how and why are certain activities attributed to women and others to men, others to either of the two and yet others to both together, and what are the bases and consequences of this attribution.

Of course, the allocation of activities according to sex is not unknown to the different cultural complexes which have predominated in the region. In some areas, the Iberian culture was superimposed on strong Pre-Colombian cultures. In other areas, indigenous cultures were of the collector type and had a very rudimentary development, such as the River Plate type. The Caribbean cultural complex, however, reveals the presence of traces of the Hispanic discoverers, and those from other European metropolises who arrived later, and of the African cultures. These processes of cultural adaptation have produced a cultural mosaic which has been inserted in a very complex form with the social classes into the national societies. However, within each national society certain cultural traits are common to all social classes.

/This is

This is why, although in general terms it may be said that the world of economic production and reproduction, factories and social work, belongs to men, and the world of the production and reproduction of individuals, the household and isolated work belongs to women, the facts are very far from supporting the thesis that between both worlds and both sexes there is bi-univocal correspondence. The relation between the cultural patterns which are developed on the basis of the sexual stereotypes and the degree of economic development is not very clear either. Even in the industrialized countries, where women have a higher rate of participation in remunerated economic activities, they continue to do so in sectors considered to be typically "female", whether in capitalist or socialist countries.

The general features of femininity (women as affectionate, emotional, instinctive, weak, non-competitive, passive, altruistic, beautiful, disinterested, fertile, domestic beings), and the different forms of discrimination in educational and labour aspects and in various other spheres are also specified according to the different social classes. But these general features and these forms of discrimination possess a dynamic which is not unconnected with conjunctural situations. Under specific conditions its total or partial force would seem to become suspended (North American women during the Second World War, women incorporated in national freedom armies, women who organize political activities and take part in mass state demonstrations), and is then resumed when the critical situation is considered to have been overcome.

It has been shown that the women from different class situations do not perceive in the same form that there is something unsatisfactory, in the definition of their roles and what it is. Generally speaking, women from the highest social strata concentrate their perception and their action on a greater equality of opportunities for both sexes while women from the lowest social strata concentrate their perception and action on improving their living conditions. In fact, the feminist movements have normally been led and made up of women belonging to the middle and upper strata, generally speaking professionals, and have not been popular among women from the lowest strata.

/Lastly it

Lastly it should be borne in mind that female and male roles are in a reciprocal relationship to and complement each other because if any problem arises in the definition of one of them there must be some problem in the definition of the other and in the two definitions as a whole.

Consequently, as has already been said, until the causes of the stereotypes are established, it is only possible to act on the contents and consequences. This opens up a wide field for the development of action aimed at gaining awareness of the absence of a real basis for many of the normative components of female and male roles, and at eliminating the discriminations originating in those components. Some of them are linked to the ideology prevailing in the national society and cut across all social classes. All receive the specification of the role of women made by the social classes in accordance with their particular position in the social structure.

According to what has been said, the minimum conceptual framework for the formulation of diagnoses and the design of policies should take account of the fact that, according to the levels and styles of development of the societies or their segments, there is a social division of labour (which includes a division of labour according to sex), on the basis of which different class situations are formed. Family units belonging to these groups practise different life strategies, one of the main components of which is the organization of work aimed at reproducing their members in a daily and generational cycle. All these facts, backed up by the corresponding definitions of sexual roles, condition the situations in which women live.

Consequently, the situation of women leads to the following types of problems: (a) those common to all individuals (men and women) belonging to the same class situation: housing, employment, education, health, income, etc.; (b) those specific to women, stemming from their social role in the class situation to which they belong, as a specification of the general cultural patterns.

This does not mean maintaining that the situation of women can only be improved if the class situations are redefined. Of course, in order to

/radically modify

radically modify the development styles prevailing in the region a radical change would be required in the situation of women and this would imply a radical change in the development styles.

Meanwhile, something may and must be done to improve the situation in which women live and the guidelines for the public policies must be consistent with the conceptual framework on which they are based.

C. GENERAL GUIDELINES FOR PUBLIC POLICIES

The question now is to formulate some general guidelines for public policies which will be consistent with the conceptual framework developed. No concrete actions are proposed for intervening in specific cases since the diversity of situations and the capacity for imagining solutions to deal with them would make any effort in this direction unproductive.

1. General considerations

It is an illusion to think that the policies and actions directed at women can be prepared and implemented without the characteristics and content of the development style selected and the global policies originating in it. The explicit or implicit answers to the questions as regards what development, why, for whom and how to achieve it, colour all the programmes, whatever the groups at which they are aimed and the sectors concerned.

In recent times, the hypothesis that development, in its acceptance as economic growth, is a sufficient condition to improve the situation of the least favoured sectors has been left to one side. Doubts have grown as to whether it is a necessary condition, since certain available data show that national economic growth may occur with absolute or relative growth of the sectors which are in a situation of critical poverty.

It has therefore been concluded that in addition to economic growth, it is necessary to generate a political will firmly set on producing the necessary structural changes. The context of this political will frequently appears to be restricted to the government sectors where the decisions are adopted and to other social forces which take part in or influence them, leaving on one side other social sectors whose participation is essential

/if an

if an efficient political will is to be formed. This means going back to earlier proposals which in their time were described as assistentialist, paternalist, manipulating, etc. Of course, a political style which consists not only in listening to the dispossessed and needy groups, but in acting with, by and for them, would be rather out of line with the political styles predominating in the region.

This discussion is not the only one of a series of old polemics which are being resurrected around the situation of women, and it is frequent for questions as to what is development, what are the dynamic elements for obtaining it, what is the most favourable organizational framework of society, etc., to reappear on the table. It is also common to find oneself faced with the proposal of a series of actions as if they had never been implemented and as if there were no knowledge or experience of them.

Vis-à-vis the problem of integrating the women's programmes into the global development programmes and strategies, two types of attitude are commonly met with.

According to one of these, the problem faced would seem to be absolutely new and it is thought and lived as if it were new, without taking into account the knowledge and experience accumulated in the course of many years. Consequently, credit is given, acritically, to widely-practised approaches and actions, without taking account of the result of these experiences, as is the case, for example, with the programmes for community development, formation of co-operatives, generation of employment and income on the basis of very low-skilled activities, etc.

This attitude which we could term "adamist" is contrasted with another which could be denominated "escapist", which although recognizing that the situation of women cannot be disassociated from national development, finds such difficulties in so doing that it ends up treating it as if it were a marginal matter and advocating prompt localized actions, of very limited effect, aimed at reaching a very small number of women and with extremely low probabilities of continuing.

Perhaps the most productive way of avoiding both extremes is to consider the problem of the situation of women as a specification of the problems of social development, taking advantage of all the knowledge and

/experience obtained

experience obtained by this and also recognizing present difficulties and limitations.

2. How to specify the group designated or the groups which are the object of policies

The recommendation to consider the situations in which women live as a specification of social development, leaves pending the problem of how to proceed to make the specification.

It would seem recommendable to begin by replacing the expressions which refer to women as participants in development or beneficiaries of it by the classic splitting of individuals into consumers and producers, taking great care in recalling that this is not exclusively a matter of the consumption and production of material economic goods but of all types of goods, services and social activities.

Two main lines are thus developed with reference to women:

(a) As consumers, i.e., from the point of view of inputs for their development as individuals. The quantity and quality of the inputs are basically determined by the class situation in which the family units to which the women belong are to be found. However, the data available call attention to the fact that in the middle and upper strata, the distribution of these inputs within the strata and their families is more equal between the two sexes than in the low strata.

(b) As producers, i.e., from the standpoint of their incorporation in remunerated economic activities, their reproductive domestic activity or both activities at once. The incorporation of women into one of these spheres of activity or both is also conditioned by the class situation of the family unit to which the women belong. As regards incorporation into remunerated economic activities, the situation of women is furthermore conditioned by the possibilities of freeing themselves from the responsibility of domestic activity, whether or not they are heads of household, whatever their marital status, the number of children, the stage of the life cycle in which their family is, etc. As regards activities in the context of domestic work, the means and resources for carrying them out receive a very precise specification according to sex. In fact, the objective of an adequate dwelling provided with infrastructure services (water, sewerage,

/electricity), benefits

electricity), benefits all the individuals, but especially women since it is they who spend all day in the house and do their household chores under more or less adverse conditions which consume more or less time. Similarly, an adequate access to education is beneficial for all individuals, but there is no doubt that in the case of women it redounds to the benefit of the entire family group and particularly the children.

In short, as consumers and producers women share with those individuals who are in the same class situation as they are the same conditioning factors of the probabilities of life and personal destiny, specified in their effects by the presence of the corresponding sexual stereotypes and cultural patterns, and the social and sexual division of labour in force. These effects must be determined for the different class situations. The situation of women heads of households is a particularly clear example.

It is also possible to consider how the female component can be incorporated into current policies. For this purpose it is desirable to analyse, even briefly and generally, some types of policies which are frequently included in global programmes and strategies and their relations with the situation of women.

(i) "Economic" policies apparently exclusively intended to influence the levels of operation of the economy (investment, inflation, industrial development, etc.). It is frequent to find that in the design and application of these policies no account is taken of their social impacts, although their direct or indirect consequences are experienced differently by the different class situations and the families and individuals belonging to them. This is one of the points in which the consequences of the analytical separation between the economic and social aspects of planning are most clearly expressed. The planners do not usually wonder about the effects which specific policies will have on the different class situation and the families and individuals (including women) belonging to them. The consideration of the probable repercussions of economic policies on the situation of women would not only redound to their benefit but also would make it possible to begin to bring economic planning closer to social planning.

/(ii) Integrated

(ii) Integrated multisectoral policies, normally aimed at increasing employment, productivity, income and access to a series of services (education, health, housing, etc.), as is the case of the policies on critical poverty or for integrated rural development. It is frequent for the activities undertaken to be directed in the last instance at the family units but in practice they tend to include only those with male heads.

Two types of undesirable effects are thus produced. On the one hand in the case of the family units with male heads, the nominal holder of the land (when there is allocation of land), of the credits, of the training and new techniques for production and marketing is the male head of the household. If to this are added the changes which the policies introduce in the already-existing organization of the work of all members of the family, this explains why a phenomenon has been detected in many of them consisting of a shift of women from the productive tasks they carried out earlier, either aimed at the market or for the subsistence of the family unit itself. Families with female heads, which in the poor rural and urban sectors account for fairly high percentages and which are usually those facing the most serious problems, tend to remain outside the scope of these policies. Consequently, this type of policy should be based on a diagnosis which will detect whether there are family units with female heads and how many they are, so as to take them into account in preparing and implementing the policies. Female heads of households are responsible for obtaining the family income and for domestic activity, with the consequent difficulties in combining both tasks and all the sequel of consequences on the dependent minors. In the case of family units with male heads, the exclusive involvement of the male head of the household in relations typical of a "modernized" economy has consequences for the social and sexual division of labour, for intra-family relations and for the socialization of the children and increases female subordination.

(iii) As regards sectoral social policies (education, health, housing, nutrition, etc.), it should be borne in mind that women figure in them from several standpoints.

/In the

In the first place, as consumers of services, and as such their access to many of these services is not on an equal footing with men, which means that it must be determined what their real access is, and what the causes are which mean that they have less or differentiated access (if this is the case) in order to adopt such corrective measures as may be necessary.

Secondly, women play a key role in the implementation of social development policies on the basis of their domestic activity, which means that their training in different aspects (hygiene, nutrition, etc.), comes to be of top priority.

Thirdly, there exist sectors in which women require special consideration (as in the health sector) or benefit particularly (basic services infrastructure housing, simple technologies or forms of organization which lighten household work). Since the different categories of individuals are not in a situation of equality, nor do they have equal social roles, these two circumstances should be taken into account in the corresponding programmes.

3. Some particular topics

It has frequently been pointed out that the participation of women in different types of association is unsatisfactory. This unsatisfactory situation would seem to derive from the small number of women who take part or the fact that when they do they have difficulty in reaching managing levels or contexts which are not those considered "typically" female. Female participation is frequently spoken of as if it could possibly be exempted from the rules of the game in force in all society for political, trade-union or any other type of participation.

The causes of the low levels of participation of women in political organizations may be found in the difficulty of combining household activity with these activities, a situation which is aggravated in the case of women who have a paid economic activity. Exemptions would therefore seem to be found rather in the upper strata and among professional or unmarried women.

Participation in territory-based associations (rural communities, neighbourhood boards, etc.), tends to be greater and may give rise to a series of co-operation and mutual activities which would have repercussions on the reduction of the load in household chores.

/As regards

As regards the policies aimed at modifying sexual stereotypes, excessive emphasis is usually given to what has been called the distortion of the female image. As has been said, female and male are complementary and reciprocally related while it is not precisely possible to speak of the distortion of the female image without this involving some type of distortion in the male image too. Consequently it should be recommended that the action proposed should not centre on female stereotypes but on sexual stereotypes.

Legislation has a wide-ranging role to fill, particularly that relating to the family institution. Joint ownership, parental authority, the duties and rights of spouses among themselves and in respect of their children, still show their Hispanic and Napoleonic juridical pedigree in the region. It should, however, be recognized, that this is an extremely sensitive and conflictive point because it involves family models with a long history and deep roots. It is often been noted that the problem does not lie so much in the lack of an adequate legislation as in the effective force of the legislation and the real possibilities of requiring its fulfilment. Despite these circumstances the moulding role of situations, behaviour and attitudes in the legislation cannot be denied, although its impact is noticeable in the long-term.

4. Alternative strategies

The conceptual framework developed and the policy guidelines described may materialize in different strategies.

The choice of an appropriate strategy will naturally depend on the conditions proper to each country, according to the nature of the problems identified, and the limitations of the conceptual framework applied, the state of the planning of social development and the real specific weight of the planning system within the corresponding development style. However, in view of the region's general situation, it may be suggested that a satisfactory strategy should: give priority to the poor rural and urban sectors; become part of the global national or regional development programmes and strategies; start off from an integrated and multisectoral approach, given the mutual reinforcement of the inadequacies recorded in the different

/sectors; take

sectors; take into account the role of the families in the daily and generational reproduction of individuals and the role in them of women, as specified for the different class situations:

Should it be decided to maintain the general development strategy in course, a procedure would be to review the economic, multisectoral and social policies to find out to what extent they consider women as consumers and social or domestic producers, making such adjustments as may be necessary.

Another line of strategy could consist in the precise definition of the groups aimed at and of a central high priority objective (for example, the supply of drinking water or the eradication of illiteracy for the entire rural population over a specific period). In connexion with this objective action could be centred, resources channelled and other objectives and programmes structured in accordance with the needs which might be established. If several countries of the region should define the same central objective, a broad field would be opened up for horizontal technical co-operation and a basic framework made available for the co-ordination of international assistance.

Another possible line of strategy, supplementary to and not exclusive of the foregoing, could be aimed at women through the improvement of the situation of the families. A strategy of this type should consider the implementation of a "minimum group of activities" which might include the following:^{10/}

- (i) Giving the head of the household, whether man or woman, a stable job, with an adequate income, and close to the place of residence of the family unit;
- (ii) Programmes for health, housing, education and basic services infrastructure, aimed at relieving the burden of household activity and allowing women to initiate other activities;
- (iii) Mass family education programmes from the primary level, particularly aimed at adolescents and couples of young adults;

^{10/} For a longer description of this "minimum group" of objectives, see the study on The family as the immediate social framework of children and women included in the present document.

- (iv) Programmes for the organization of families in associations based on the neighbourhood or the community;
- (v) Legislative measures aimed at supporting the above actions and objectives.

This group of actions is considered minimum because the lack of any of them leaves untouched the restrictions which condition the organization of the poor family units with the sequel of consequences on the situation of their members, and particularly of women and children. It is also considered minimum because the governments of the region are to a greater or lesser extent implementing policies in nearly all the directions indicated, and earmarking for these purposes human and financial resources, the co-ordination of which would increase their efficiency and make it possible to increase the rationality of the utilization of international technical assistance.

/II. THE

II. THE FAMILY AS THE IMMEDIATE SOCIAL FRAMEWORK OF CHILDREN AND WOMEN

Study prepared by CEPAL and UNICEF for the UNICEF document on "The situation of children in Latin America and the Caribbean" submitted to the Executive Board of UNICEF at its special session in May 1979, and as a working document for the appraisal of the situation of Women in Latin America and the Caribbean to be undertaken by the Second Regional Conference on the Integration of Women into the Economic and Social Development of Latin America (Macuto, Venezuela, 12-16 November 1979).

The following table shows the results of the experiment. The first column shows the number of trials, the second column shows the number of correct responses, and the third column shows the percentage of correct responses. The data shows that the percentage of correct responses increases as the number of trials increases, indicating that the subjects are learning the task.

Trial	Correct	Percentage
1	0	0%
2	1	50%
3	2	66.67%
4	3	75%
5	4	80%
6	5	83.33%
7	6	85.71%
8	7	87.5%

BIBLIOGRAPHY ON THE FAMILY AND WOMEN	95

A. INTRODUCTION

In the section describing measures which should be taken for the incorporation of women into active economic, political, social and cultural life, the Regional Plan of Action for the Integration of Women into the Economic and Social Development of Latin America devotes a subsection to the family, considered as "the nucleus which generates and transmits the values, norms and attitudes that orient the individual and collective conduct of the members of a society" and "a mediating institution between the individual and the social group" (paragraph 35). The section sets forth a series of action proposals which take into account not only the importance of the family for the situation of women (and viceversa), but also the importance of the family and of women for the healthy development of the children.

Furthermore, the United Nations General Assembly, when proclaiming 1979 as the International Year of the Child in resolution 31/169, decided that one of its objectives was to be the promotion of the welfare of children and the increased awareness on the part of the authorities and the general public of the special needs of children, and requested the bodies and organizations of the United Nations system to contribute to the preparation and attainment of the objectives of the International Year of the Child.

In conformity with these two mandates, and recognizing the real importance of the family as the mediating institution between the individual and the social group, the UNICEF Regional Office for the Americas and CEPAL have prepared this document containing their appraisal of the situation of children and women in Latin America and the Caribbean.

1. The family as a unit which produces goods and services and reproduces social agents

In order to understand the nature of family units in Latin America and the Caribbean, account must be taken of the way in which they are related to the economic system. For this purpose, it is necessary to consider their role in the production of goods and services both for the market and for their own consumption, as well as the activities they carry out in relation to the reproduction of the social agents which are its members (food, housing,

/clothing, infrastructure

clothing, infrastructure services, etc.). Production by family units for the market or for their own consumption is rare in urban zones and common in rural zones. In addition, within each zone there is a great variation in the quantity and quality of the activities undertaken by family groups, as well as in the objects and goods they possess for the daily and generational reproduction of their members.^{1/}

Nevertheless, although the insertion of the family units in the economic system largely conditions how they function and develop, the family cannot be reduced to this dimension; the reproduction of social agents is not limited to biological and economic factors but includes other equally important aspects such as the conscious and unconscious learning of social relationships, language, cultural norms and patterns and values, all of which is strengthened by the affective components of primary, intimate relationships, which are particularly important in the early years of life.

It is in the family units that the biological, psychological and social individuality of the younger members is shaped and developed, and adults satisfy most of their material needs and receive most of their psychological gratification or deprivation. Furthermore, they are small groups with primary relationships, whose size is determined by the consanguineous or ritual forms of kinship prevailing in society.

This is enough to indicate the importance of the family as the immediate social framework of children in particular, and of the population in general; and to underline the fact that family units are points at which different levels of society (individual, group, societal) and different social dimensions (economic, educational, legal, cultural, etc.) intersect.

2. The family as the object of policies

(a) Differences between policies aimed at the family unit and policies aimed at some of its members (children, women)

As a rule, policies designed to affect the situation of children and women or the social conditions of the population have tended to overlook the family units to which their potential beneficiaries belong.

^{1/} For a definition of "daily reproduction" and "generational reproduction", see the first study in this document.

/Furthermore, the

Furthermore, the policies designed to affect family units as such have dealt with specific aspects (usually birth control, mother and child health), without bearing in mind that the behaviour and relationships which form the life of family units respond to the needs that the units must tackle in their specific class situations. Naturally, the growth of mother and child health services or training of women, for example, will have some effect on the family, or on some families. But by failing to take into account the social relations which form the family unit, they can only have partial or palliative effects, especially if services of that kind are defined on the basis of uniform norms which assume that there is one single form of family unit constituting the national "type".

As far as children are concerned, in the last analysis specific policies are policies dealing with children whose situation is determined by the family. It is increasingly accepted, for example, that pre-school education services cannot be provided without the co-operation of the mother and of the family to stimulate the child. In addition, a policy implemented through the mother as the reproductive agent may strengthen the sexual division of work and perpetuate "female" responsibility for certain tasks, thus conflicting with other policies aimed at securing greater equality between family members.

Policies and measures aimed at women can hardly take account of the complexity of their tasks and responsibilities in the daily and generational reproduction of social agents and, in many cases, in social production. On the one hand, there is a tendency for women's ties with domestic labour to be strengthened, thus accentuating the sexual division of work and ignoring women's contribution to production. On the other hand, vocational training for the incorporation of women into a restricted labour market leads to family and social tensions as a result of the shortage of real job opportunities and prevailing cultural patterns.

The family is a policy object when it is recognized as a unit, with forms of make-up and conditions of existence as a group, with mutual relationships among its members, with stages of a certain duration, and with consequences for the life both of its members and of society. Thus policies aimed at the family are policies designed to maintain or modify all these aspects in accordance with models of how the family "should" be.

/Hence a

Hence a problem arises for policy formulation: the existence of implicit or explicit family models upheld by different institutions and by the families themselves and their members. It must also be recognized that in situations of relatively rapid economic and social change, children will tend to form families of a type different from those into which they were born; policies aimed at their members should therefore take this dynamic process into account.

(b) The family as a target group and as a strategic group for policies

It is a commonplace to refer to the family as the basic social cell, and it is therefore worth pausing to consider the assumptions underlying this assertion: families have very different ways of being this cell. Nonetheless, in the style of development which prevails in the region, they are all, as individual units, responsible for the daily and generational reproduction of their members, tasks which they shoulder directly or indirectly. This means that families have the task of obtaining the necessary resources for both types of reproduction, and thus domestic activities have an importance normally not recognized either by economists or planners, or even by the women themselves who have to undertake them.

The family organization is the most immediate social context of almost the entire population, and thus may be taken as a target group and as a strategic group from the policy standpoint.

When the family is taken as a policy target, various dimensions of the family group are taken into account:

(i) Its constitution, development and dissolution: age at which the couple forms the union; formalization of unions; number of children; stability of the union; etc.

(ii) Its internal relationships (husband-wife, parent-children, among siblings, nuclear family-kinship network, early forms of socialization; communication; authoritarianism; machismo, etc.);

(iii) Its external relationships as a group and the various circumstances which affect it (income, housing, infrastructure services, access to services, etc.).

/When the

When the family group is viewed as a policy target, this is because there is something about its present form or its repercussions on its members or society which it is desired to maintain or change. This attitude presupposes some idea of what is desirable or undesirable in family organization.

However, the prevailing form of family organization is vouchsafed by sets of deeply-rooted norms, values and beliefs which lay down 'who does what, with what and when', every day throughout the life and family cycles; and these are based on the habits, traditions and practical daily experience of the life of the family.

Consequently, policies designed to maintain or change family organization or any of its multiple dimensions must begin with an understanding of the real forms of organization currently in existence and the rationale on which they are based.

When family units are taken as strategic policy groups, what is being recognized is that they form the immediate social context of individuals and, particularly in the case of social policies designed to improve the quality of life of the population (health, nutrition, education, housing, etc.), the fact that a steady improvement in the situation of individuals and, in particular, of children and women, cannot be achieved without taking into account the family conditions in which they live their lives.

One example will serve to illustrate this point. The increasingly severe problem of abandoned children tends to be attributed to the breakdown of family organization in the poor urban sectors of the population and, as a rule, the policies formulated are directed towards children as individuals. When speaking of family disorganization, a comparison is tacitly being made with the forms of constitution and development of organized families, thus overlooking the fact that the disorganization of the family is merely a specific way whereby certain sectors of the population organize their family life in certain circumstances. Thus the policies which have abandoned children as their target group, consider them as individuals and do not affect the situation of the families from which they come as a strategic group for those policies, will not attack the root of the problem, which will therefore persist or worsen. Mutatis mutandis, much the same can be said

/of policies

of policies aimed at increasing school attendance, reducing school drop-out and repetition, improving health and nutrition, avoiding prostitution and begging and, in general, improving the status of women.

(c) Importance of locating family units in their social situation

The assumption that family units are similar throughout the country or, at least, in rural zones or in urban zones, may lead to errors of analysis and to the adoption of policies whose effects are not those desired.

The class situation of a family is a key factor in policy formulation, since it conditions the forms in which the family unit is constituted, the relationships among its members and with society, the permanence of the unit as a group and, ultimately, the probabilities and type of life in store for the unit and its members.

The life cycle of family units has stages which can perhaps be categorized: union, birth of first child, first child goes to school, last child leaves home, death of one or both spouses; but this cycle will be affected by the class situation in ways which it is important to recognize when adopting policies. It is probable that the duration of the stages of the family cycle is not the same for units in different classes; nor are the problems they face, the conditions in which they attempt to overcome them, or the solutions they find. Thus the different social situations condition the life strategies whereby the family units organize and use the resources they possess in order to carry out the daily and generational reproduction of their members and structure their demands upon society.

B. FAMILY CHARACTERISTICS IN LATIN AMERICA AND
THE CARIBBEAN

1. Family trends and economic and social change

In the last two decades the region has undergone rapid economic and social change which has affected the living conditions of family units and their members. This is borne out by even a cursory review of some of the main processes which have, naturally, affected the different countries of the region and the different zones of individual countries to a varying degree.

/In national

In national terms, there has been a falling trend in birth rates and a rise in life expectancy at birth. Some sectors have maintained their fertility and, with declining mortality, the average number of family members has increased. Others, particularly the metropolitan middle strata, have managed to control their fertility and have arrived at families with an average number of members resembling that of some developed countries.

The processes of agricultural modernization, carried out primarily through improved technology and land concentration, have given the rural sector a dynamism far removed from its alleged immobilism, and broad sectors of what were once smallholders and share-croppers of various kinds (minifundistas, aparceros, medieros, etc.) have increasingly become permanent or seasonal wage-earning labourers. These rural changes have been recognized as one of the causes of the high rate of internal migration. The two processes are seen as having a series of consequences on the situation of families, including the change in the composition of the population by age and sex, in the places both of origin and of destination of the migrants, with the ensuing effects on the formation of unions; the substantial change in the ways in which families obtain their income in cash or in kind, with the corresponding effects on the sexual division of labour and the distribution of authority within the family unit; the difficulty for children to have jobs similar to those of their parents, with its effects on the application of the knowledge, norms and values learnt in childhood; the commercialization of agriculture, which is increasingly linked with international markets at a time of a slow but steady deterioration in the terms of trade, and the monetarization of the rural economy, with its effect on income levels and nutritional difficulties; the urban settlement of newcomers in the "poverty belts" in unsatisfactory housing conditions characterized by overcrowding and sanitary and environmental problems.

The industrialization process, which in recent decades has mainly taken the form of investment in capital-intensive activities, has not generated enough jobs to absorb the supply of labour stemming from the natural growth of the population. In addition, it has been centred in the major cities and its effects have spread to the rest of the country, destroying the subsistence economies and artisanal production. Only a small percentage of the

/population has

population has managed to become incorporated in the modern urban sector of the economy, and the State has had to intervene by creating jobs. The rest of the urban population, with few or no skills and no capital, have to find a way of obtaining an income in sporadic employment or the "informal sector". In the stratificational pyramid, the middle and top layers have a sufficiently large money income to purchase consumer durables to lighten the burden of domestic work and have access to suitable housing, education and services; and from this set of factors they obtain the basic motivation to have a nuclear family with few members. The situation from the middle layers downwards is considerably different.

Nevertheless, the rapid rate of change in family living conditions does not imply a similar rate of change in values and attitudes, patterns and lifestyles as regards the family and relationships among its members. This is particularly obvious in the survival of patterns and attitudes regarding the role of women and authority within family units.

2. Size, type and composition of households

The quantification of the various characteristics of families is of the utmost importance for an understanding of the magnitude of the problems and the formulation of suitable policies.

However, the very complexity of the subject stands in the way of definition and, consequently, measurement. In general, information on the family stresses these difficulties, which begin with the realization that the family is not the same as the household, and that taking the household as a domestic unit is very different from taking it as a housing unit. Censuses opt for one or the other concept, which limits their comparability. Much the same is true of surveys. In addition, the data given usually corresponds to national or residential area averages, which harbour profound differences. Moreover, the averages do not record the different stages of the family life cycle, which must necessarily be taken into account when formulating policies for children, women, housing, education, etc. It should be noted that the information obtained from the 1970 round of censuses as regards average size, composition and type of households has not been processed for the region, and there is only isolated, time-specific data for a few countries.

/With these

With these reservations, a review follows of the data available on the major aspects of families.

(a) Average size of households

As may be seen from table 1, the average size of household in the region is large in comparison with the industrialized countries, and broadly speaking tended to rise in the inter-censal period 1950-1960 and decline in the following decade. The demographic explanation for this lies in the constant or declining fertility rates and the rapid drop in mortality rates which together not only increase the number of surviving children but also prolong the duration of unions and consequently the total number of children. As may be seen from tables 2, 6 and 7, however, these national averages present great variations, in particular the differences among countries and the inverse relationship between a country's level of development and average household size. There are also differences by zones of residence, since urban zones usually have the smallest average size within countries. The use of birth control, access to services which tend to reduce mortality, and pressure for upwards family mobility affect the number of children and the average size of households, which also varies according to a series of other factors. Extended households, with a male head belonging to an advanced age cohort, married and economically active, tend to be larger in size.

(b) Type of household

Nuclear households predominate in the region, i.e., households consisting exclusively of one or two parents and their children. This predominance increases with urbanization and industrialization (see tables 3, 4 and 5). The nuclear family predominates in the case of male heads of households, who are married or have formed informal unions and are economically active. This might indicate that in most cases women only become heads of households in the man's absence and, in those cases, turns to other relatives or unrelated persons to increase the household income, to have someone to do the domestic tasks while they work, or for social security reasons. These would appear to be the survival strategies of households with female heads.

It should be borne in mind that the census of household types indicates a pattern of residence rather than kinship network and their functions.

a/ The author establishes that the departamento of Belén belongs to one of the least developed provinces of Argentina, Catamarca, which is an area of agriculture and traditional artesanal activities, with a very small urban zone (a little over 1 500), it is therefore an interesting case in view of its extreme features. The canton of Grecia in Costa Rica is a sugar- and coffee- producing area, crossed by national highways and close to the capital. In the canton a census was taken of the typically rural districts of San José and San Isidro and the urban zone.

(c) Composition of households

Tables 6 and 7 show the average components of households and the percentage contribution of the different categories of members to that average. Since the various categories of members are defined by their relationship to the household head, the latter appears as a constant whose percentage contribution declines with the rise in the number of members, a fact of no little importance in intra-family relationships. The percentage contributions of the categories made up of spouses and other relations do not vary systematically with the number of household members, and thus the basic category in the variation of household composition is the number of children.

Considering the countries for which information is available for two years (Mexico, Costa Rica and Nicaragua: see table 6) it may be noted that in a ten-year period the variation in household composition has only changed slightly.

The variations in the percentages accounted for by the spouses of the household head and other members may be due to a number of reasons, including death, other forms of dissolution of unions, internal migrations, or other situations solved by residing permanently or temporarily in the home of relations.

Since the poor rural and urban households show a large number of children, the low family income becomes a relative per capita income well below the national average. It is one of the reasons which explain, in these sectors, why women work at any activity which allows them to earn some income, and also the fact that children begin to work at an early age, with a corresponding effect on their education.

(d) Other aspects

The average age of marriage or marital union varies both among and within countries. In Chile, in 1968, the national average age was 26.5 years for men and 23.9 years for women, while in Bolivia, in 1969, these ages were 21.8 and 20.2 years respectively; in Rio de Janeiro, in 1969, the average age at which women married or entered unions was 21.1 years. Various studies have shown, however, that age at marriage is directly related to urban residence, parental status and level of education.

/Legal unions

Legal unions predominate over consensual unions in the region, but the marriage rate, which refers only to the former, varies directly with urbanization and the size of the middle strata in relation to a country's total population. In addition, consensual unions increase in rural areas and in the low urban strata, and tend to occur at an earlier age than legal unions.

In the urban zones of the region, as in the developed countries, there is a rise in the dissolution of legal unions by divorce or separation. This tends to be more frequent in unions which have lasted between 6 and 15 years, and if the marriage took place between young persons, if the household head has no stable work or if the wife works outside the home.

This is enough to indicate that the quantitative information on families does not refer to relationships within or outside the family; in addition, it displays the serious lack of research and quantitative data without which the magnitude and extent of the problems and the costs involved in the formulation of policies cannot be assessed.

3. Some particular situations

In describing some typical cases in a variety of social situations, the aim will be to give an account of the family's set of internal and external relationships and the structural elements which shape its particular life strategy, with special reference to the implications for women and the situation of children.

(a) The family of the small agricultural producer

In the social stratification of the rural Latin American population, the small agricultural producer falls in the "intermediate" group located between the large rural entrepreneur at one end of the scale and the landless labourer or smallholder at the other end. However, these groups are not homogeneous. They are being affected by the changes which are taking place in the rural societies and economies of the region in recent decades, largely as a result of the technological modernization of agricultural production, the growing incorporation of the rural economy to the national economic system, and the natural growth of the rural population. There are major differences, for example, between the small producers (and their family units) who are progressively being taken over by modern agricultural enterprises and those
/who have

who have access to capital and technology and are beginning to grow and modernize. There are differences between the small producers engaged in specialized production for trade and industry and those engaged in a variety of activities primarily for subsistence; and between those who do not need to work as wage-earning labourers and those who do, albeit seasonally. In the present study we shall describe above all the family units of the latter sector, the small producers who engage in seasonal paid work.

The small agricultural producer works a piece of land which suffices for the subsistence of his family unit. With little or no modern technology and few natural resources, his productivity is very low and therefore his position has sometimes been assimilated to a situation of disguised underemployment or unemployment. The subdivision of the smallholding and the deterioration of the soil cause his annual income to drop steadily, a problem which he tackles to some extent by working some of the year as a labourer. Thus he has the dual status of labourer and landowner which recurs throughout the life-cycle of the family unit. The elder son, who has had to go out to work as a labourer, on marriage returns to work the part of the family smallholding which has been made over to him, and in turn works part of the time as a wage-earner. The children who cannot receive land join the rural or urban labour force as labourers or own-account workers, with the result that the knowledge, norms and values they have acquired within their families are hardly applicable. The lot of the daughters is marriage or migration to the city to find domestic work or attempt to continue their secondary or technical education. As a rule, the probability of reproducing the family unit is low and the consequences of the life strategy end up being the smallholding or migration.

The family unit as such is responsible for social production (working the plot, marketing and reproduction of the process) and partially for the reproduction of the social agents (housekeeping chores, preparing food, making clothes, minding the children, raising poultry and small animals, vegetable gardening). These reproductive activities are subordinated to the needs of production, with the result that family consumption is affected by the fluctuations of harvests or the income obtained from them. The sexual division of labour is based on this distinction between economic work and

/domestic work.

domestic work. The man and his sons are responsible for the tasks involved in social production; the women for the tasks involved in the domestic reproduction of the social agents, although they also work in the fields when necessary.

Authority is exercised by the husband or the wife according to the sphere in which a decision must be taken, although decisions about social production are always more important. At an early age the children begin to help with household tasks and little by little join in productive work. In some cases they are given a small patch of land or an animal which they raise from an early age and for which they are totally responsible. Besides providing a little capital which the son or daughter can administer freely, this practice is a form of training for the tasks they will have to shoulder as adults. In the case of artisanal activities, these are undertaken as family work in which each member carries out a specific task.

The housing has the minimum conveniences: two or three rooms acting as bedrooms and kitchen (which sometimes serves as a dining room), latrine, well and wood burning stove.

Despite the expansion of education in rural zones, which leads to a better educational level in comparison with parents, school drop-out and repetition are normal since it is difficult for the family to do without their children's labour during all or part of the school year. Women have a better educational level than their brothers, which is one motivation for migrating with the support of relations residing in the city. High value is attached to education as a mobility factor. An "educated" person has authority, is "intelligent", and is "not suited for the countryside". Health is affected by the nutritional conditions which vary seasonally according to the type and quantity of product available once the proportion of the harvest set aside for sale has been fixed. Food is little varied and access to other products is difficult, because of high prices and distance from markets. The possibility of professional medical care before, during and after child birth is very limited. Children are born at home and the mother is cared for by a local midwife.

/Marriage tends

Marriage tends to be legal, although consensual unions are socially accepted. Residence is patrilocal, due to land subdivision. The number of dependents per household may be high because of migrations of persons of working age. In many cases, the household head looks after the grandchildren, the children of the girls who work in the city and have become unmarried mothers.

In these units there is no separation between household and place of work. The members share daily the vicissitudes of work together as well as all the major events in their lives. The family is a closed and almost complete nucleus. Time is organized according to working and living needs with virtually no free time or holidays. Daily work repeating practices handed down from generation to generation, the mutual dependence of joint work, the consequences for all members of the work and consumption of each of them, the fact of remaining together all day every day, all mean that in general these units are very stable because of the solidarity of all their members.

Social relations are based on family and compadrazgo links which provide means of control and cohesion. Their view of the world, related to nature and the local residential area, has been influenced by the mass media, contact with distant markets and relations in the cities, and seasonal migrations. They continue to be inward-looking family units, without any capacity for social organization and thus without any real possibility of exerting pressure or making demands on society. The identification of their members with the family unit rather than intermediate groups makes it impossible for them to perceive their situation within society as a whole.

The economic insecurity of these units - with little or no weight in the market, limited access to credit and dependent on any factor affecting their social production, almost always of a single product - is largely determined by the type of social and organizational relationships described above, with obvious consequences on their potential for change and the effectiveness of policies aimed at them.

/During the

During the period when the men migrate, the women become responsible for the family unit, which leads to the case of seasonal women household heads. This has a series of consequences for the situation of women (normally unused to carrying out tasks which bring them a money income) and for the family unit.

(b) The family of the seasonal labourer in the plantation sector

When the large and growing numbers of landless workers are unable to establish contractual or traditional links with a large estate on a permanent basis and do not emigrate to frontier regions or distant urban conglomerations, they usually settle by squatting on land adjacent to the large estate or along the road-side, or else on the periphery of small nearby settlements.

The virtual absence of a family plot which would provide for their family needs forces them to seek work in places which are sometimes quite distant. At times they are hired in groups and transported daily or for a season to places of work. On other occasions they themselves form groups which emigrate seasonally in search of work. This circumstance means that the men are away from the households for the whole day or for longer periods. Housing is primitive and offers little shelter from nature. There is no drinking water or electricity and natural functions must be satisfied in the proximity of the dwelling. The small family income is almost entirely consumed by inadequate food and clothing. The organization of family work is governed by the logic stemming from the desperate economic situation of units of this kind. Men are responsible for obtaining a money income and, shouldering this obligation, are absent for more or less lengthy periods. In their absence, women become the household heads and survive, with the help of the children, by obtaining some food from the small vegetable plot around the dwelling, selling some products grown in that plot or gathered in neighbouring fields, or making and selling some kind of handicraft; they usually also carry out some domestic work in a nearby house where they can earn a wage, however small. In any case, they are responsible for the tasks directly related to daily and generational reproduction: fetching water and wood, preparing food, looking after clothing. If they too must leave the home, an elder daughter becomes responsible for these tasks. However little able to do so, all children attempt to obtain some kind of income (in money or kind).

/These unions

These unions tend to be informal, unstable and frequently headed by women, although often this is merely an appearance resulting from seasonal work or living conditions. This type of family unit tends to have a large number of children.

Exposure to the mass media is very small. They are not wholly uninformed, but what information they receive from urban areas is deciphered in the light of their own reality. Personal relationships are one of the main sources of news, which usually concerns job possibilities.

The availability of, and access to, education and health services are minimal. Normally there is a distrust of government agents; they feel cheated by them, since on the one hand they hope that they will solve their most vital problems, and on the other they consider them directly or indirectly responsible for their present situation.

In this general context, relations between spouses, in the case of stable unions, have a very low level of verbalization; what they have is basically a solidarity and undisplayed affection which stems from having to share extremely difficult situations. The parental models internalized by the children are those of an absent, sporadic or rotating, authoritarian and incommunicative father, and an intro-punitive mother, overburdened with work, but closer and providing what little display of affection they receive.

The project of these family units usually maintains the illusion of gaining or regaining a piece of land, educating the children sufficiently to improve their general living conditions, and escaping from poverty. However, given the overall processes in which they are caught up, the probabilities of succeeding in doing so are very small. The greatest likelihood is that they will continue in their present situation or be forced to emigrate to the urban periphery.

As was pointed out earlier, the woman in this type of family unit, is either permanently or de facto seasonally the household head. In these circumstances, she is responsible not only for everything that has to do with generational and daily reproduction (food, clothing, child-care, etc.) but must carry out all these tasks in the worst possible conditions. In this type of family unit it is impossible even to think of making any kind of investment to improve the conditions of domestic work. In addition, the woman remains

/responsible for

responsible for maintaining the unit in the absence of her spouse, for which she undertakes any kind of activity which enables her to gain some income, however small: harvest work, handicrafts, occasional or regular work. In view of her educational level and the daily situation as described above, it is easy to imagine the content of the education she transmits to her children. One aspect of this content which is handed down, however tacitly, concerns the different roles of men and women.

In the above conditions, it is not surprising that children have high rates of malnutrition, with their sequel of intestinal and parasitic diseases and high mortality rates. The children of these family units, if they are able to get access to the formal educational system, hardly get past the first years of primary education, so that in the best of cases they end up being functional illiterates. This is the result not only of the low incomes and the living conditions of the family unit but also of the need for them to start working at a very early age to gain some kind of income. Thus they remain in a position in which they can only undertake unskilled work, and constitute the great mass of potential migrants. If the family migrates to the city when they are still young, they will have access to education and health services and so on, although some of them will resort to begging, delinquency or prostitution.

(c) The family of the Andean altiplano

The information available refers primarily to Aymara families living in a radius of up to 100 kms from the city of La Paz. However, it is widely agreed that the strong survival of pre-Colombian cultural patterns and the similarity of the colonial forms of organization of agricultural property mean that this information also extends to the native communities of the Peruvian and Ecuadorian altiplano, with the variations stemming from the historical evolution of each.

The families own small pieces of land, the titular owner being the male head of family. Agriculture is the main activity, not only as a means but also as an end, with risks reduced to a minimum and the security of the family unit's subsistence raised to a maximum; this determines what is virtually a self-contained form of living. There is almost no mechanization and only the minimum technical or administrative assistance. However, the marketing network has increased with the creation of local markets and contacts with urban markets;

/crops are

crops are harvested for these, in order to obtain cash incomes. There has also been a rise in the consumption of industrial goods (transistor radios, bicycles, ready-made clothing, etc.).

This expansion of the market has led to building along the roadside, and changes have occurred in housing characteristics: zinc roofing has tended to replace straw; the number of rooms increases, sometimes to as much as three; windows are installed. However, the typical household remains the set of relationships among persons who eat together and sleep in a group of two or four houses built around a patio, with rough furniture made by the members themselves, without electricity, drinking water or sewerage, and without any division between the housing and the pens for chickens and other animals.

The family units must obtain their food, clothing and housing from the product of their plots. Every year similar quantities of the same products are sown and similar harvests reaped. As a rule, the portion for consumption by the family is considered more important than the portion for marketing, whether by barter or sale. Producers market their own harvest for cash income, either in person or through intermediaries from their own community. Since the incomes in cash and kind from agriculture are inadequate, they supplement them with other activities (carpentry, labouring, etc.). In addition, in order to earn extra money the men migrate seasonally for a few weeks or months of the year. The resources stemming from the smallholding, either for consumption by the family or for marketing, and from other activities, as well as the money earned during these temporary migrations, is in all barely sufficient to guarantee a minimum level of subsistence. In a situation where money income increases in importance for obtaining food and clothing, interest in possessing other industrial goods has grown and patterns of expenditure linked with responsibilities stemming from different holiday festivities and forms of compadrazgo (baptism and marriage being most important) continue to prevail.

The main agricultural operations are the responsibility of the family head, assisted by the other members when necessary, which is nearly always. His spouse controls domestic matters; helps in the fields; washes; dries; cards; spins and weaves the wool. When her children are small and her other /obligations leave

obligations leave her the time, she goes to tend the sheep from the early hours of the day until the evening. Although shepherding is the main economic contribution of children over six, they also help in domestic chores, looking after their siblings, and fetching water for the home. Within this overall organization of work, the form in which migration takes place in order to earn extra money incomes is a source of variation in the organization of the family units throughout the altiplano.

Girls marry between 13 and 22 years of age, and young men between 20 and 25. Marriage by abduction is common and was the rule in the past. A bachelor is considered to be an incomplete person. Families are very stable, which must be viewed in relation with family ownership of the land and an overall form of life in which the family is central. The average number of children per family is a little over five.

These units have their own communication media consisting of their relations, whom they see during holiday festivities or on special visits. Transistor radios have linked them to the national community, but not newspapers and magazines, since few of them can read Spanish.

The services they receive are very rudimentary and the greatest importance is attached to education. In almost all communities there is a school with a few teachers, often paid by the community itself, who provide a number of courses, live in the city (which affects their daily attendance) and, in some cases, have language problems, which is also usually the case of most public service officials. They continue using traditional healing methods, although sometimes they also use modern medicines. Foreign religious organizations make a major contribution to educational and health services. In general, they do not have postal and telegraphic services.

These families move within a number of relationship networks, which include: the persons living in the same group of dwellings which they regard as their home; the relations and other persons whom they visit frequently; their distant relations; and their relationships stemming from the exchange of labour and financial assistance (ayni, minka).

/Children are

Children are expected to be silent, hard-working, courteous, meek and well-behaved. They continue helping their parents and the land is distributed only upon the latter's death. Thus until that time they are not completely independent. Parents are expected to be affectionate towards their children and to look after them. Their links with their children and the close relationship between the children and the parental home continues despite migration.

With the expansion of the market, the possession of a lorry has become the ambition of the heads of these units. Meanwhile, the children's education is considered to be of key importance and the school is the most discussed topic in meetings: buildings, holidays, the ability of the teachers. Generally they accept that their children should go to the city and learn a profession or job in order to become as similar to the urban young people as possible.

The possibility of survival of this type of family unit is threatened on a number of fronts. On the one hand, the land is too heavily populated to be able to accommodate the younger generations and, when marrying, the elder sons must seek other work. The younger children remain with their parents, but when the plot is divided out among the many children, the shares are inadequate for each member. In addition, the market facilities have paved the way for migration. Most adolescents wish to leave the community: the girls, to be sales-girls or maids, the boys to work as bakers, truck drivers, tailors or industrial workers.

Mention has already been made of the quantity of domestic work done by women, as well as the various activities they carry out in connexion with production from the family land, shepherding and weaving. But that is not all. The woman is usually responsible for marketing the crops for a cash income. While still girls they begin to travel to the urban market where, little by little, they learn selling skills and build up a stable clientele, which brings them further clients. They themselves become the clients of other sellers in their own community and local markets, from whom they purchase merchandise for resale in the urban market. They have relations (uncles, brothers) with whom they can lodge if necessary, and from whom they receive support. The woman thus becomes an important prop for the economic welfare of her family.

/Both parents,

Both parents, but particularly the mother, are responsible for informal education regarding domestic skills, healing with herbs, aspects linked with magic and religious rites, prophecy, kinship networks and traditional measurements of time, space and weight. The children learn all this during their early socialization, but it is of little use when they move to the urban environment, except when they return to the countryside to help their parents.

Sexual stereotypes are pronounced from an early age and subsequently take the form, inter alia, of the refusal of many of these families to send their daughters to school. During infancy, games are separated by sex, and usually best friends belong to the same sex.

Children are breast feed for at least two years. Then diet is usually deficient in calories and proteins. Early childhood is usually referred to as "the dangerous years", because diseases such as diarrhoea, scarlet fever, dysentery, influenza, and tuberculosis are rife.

One of every four live births dies in childhood, and of these half die before the age of five, and a quarter within a year. There are also cases of infanticide linked with illegitimacy, incest or large families.

Girls rarely complete three years of schooling, while boys on average complete four years. Sometimes they go to adult night school. Despite the great value attached to it, education is always subordinated to the need to fit it in with the organization of family work.

Girls and boys acquire from their parents the training for subsequent occupations in agricultural activities. Adolescent girls begin to learn marketing skills from their mothers. In addition to agricultural activities, the boys learn other occupations once they have done their compulsory military service, or even earlier if they have gone to live temporarily with a relation in the city.

As regards the family unit, however, shepherding is the children's main economic contribution, beginning at 4 or 5 years of age. At 8 years of age girls and boys go to the mountains far from the village to tend their flocks alone. At about 10, they become responsible for cattle and mules, if there are any. The older children also go to the mountains and stay there for a week with other relations with whom they have gathered the flocks for grazing.

(d) The family of the "informal" metropolitan sector

The family units of the so-called informal sector, comprising the independent workers with no capital and wage-earners engaged in sporadic activities with few or no skills, survive on the collective contribution of their members to the family income.

The husband does jobs usually linked with personal services and construction, and receives an income which is not enough to feed the family. Hence an essential element of the family's survival strategy is the economic contribution of the wife and older children. The income provided by the women is particularly important in the case of consensual unions, which are very frequent in the region, where there is a kind of shared responsibility for obtaining the basic resources for consumption. The job instability or unemployment of the head of the household and the short duration of unions are factors which lead to a high rate of single-parent families in which the mother becomes the household head, the source of authority and the economic support.

Domestic service in homes, personal services carried out in her own home and trade are the woman's main sources of income. Unlike other women from other poorer urban sectors, the women from the informal sector tend to be permanently employed since their contribution to the family income cannot be interrupted if the family is to achieve subsistence levels.

The older children reproduce the occupational activities of their parents, leaving school at an early stage and with no job skills whatsoever. In the case of families with very low incomes - usually single-parent families - the younger children also become involved in work or begging. Sometimes they are handed over to better-off relations. Persons who do not belong to the family nucleus (relations, recent immigrants) may provide a further contribution in terms of income or replacement in some domestic or educational tasks.

The family units of the informal sector recently incorporated into urban areas are found in different ecological contexts, either crowded in old housing in the ageing city centre or, more typically, in peripheral shanty towns which have resulted from spontaneous or organized squatting. In this context the proportion of young people is higher than in the rest of the city,

/as is

as is that of children aged between 0 and 9 years. Although the nuclear family (with both parents or only the mother present) is characteristic, at times there are "complex" families made up of a number of family nuclei, consisting of from 4 to 7 members, sharing some facilities but retaining their economic independence. Despite the sector's typically limited ability for autonomous organization, as a result of organized mobilization for land occupation there have been instances of the installation of community kitchens, laundries and baths run by local committees. The social relationships which are formed tend to be based more on family links or informal groups in the same residential area than on any type of organization. The compadrazgo system is the primary mechanism of assistance and union among family units, both in the city and with relations who still inhabit rural zones.

The housing is built by the families themselves using scrap materials; services are minimal (water available from a central tap serving a number of houses or distributed by municipal tankers, lack of sewerage and electricity, which is sometimes illegally tapped from the public electrification grid). Although very soon the family begins to raise a more permanent and solid dwelling on the same spot, the family project attaches greater priority to gaining a deed of ownership to the land it occupies, a local school, and electricity rather than housing as such. This ranking is very often contrary to government policies aimed at eliminating extreme poverty or urban planning policies, which are aimed at providing housing before any other services, for which purpose the families in question are committed to paying mortgages. This is shown by the fact that families frequently leave such housing in order to return to their earlier places of residence.

The family income fluctuates between levels of indigence and subsistence. Food and clothing account for all the resources available for family consumption, for which the income of the household head is not sufficient. Only rarely is some amount set aside for housing improvements; and never for saving. Health and education are viewed as the responsibility of the State. The head of the household is illiterate or has only completed the first two years of primary education. He has no formal skills, although as a result of his experience in different kinds of work and as a means of increasing his job opportunities his minimal occupational skills are wide-ranging. The

/occupational level

occupational level of the wife is always lower, and the children are usually several years behind at school or have dropped out altogether. The father has formal authority, although the structure and coherence of the family nucleus is based on the mother, whose presence is more permanent - and sometimes she is the sole parent. The woman carries out domestic chores with some help from her daughters, manages the family budget and is responsible for socialization and the survival of cultural patterns. Her social status is lower than that of the man, and she participates less in formal organizations. In some cases, however, it is the older women who are responsible for contacts with government officials and mobilizing the population of their shanty towns when the authorities so require. This role may be explained by their greater willingness to negotiate, and because they directly feel the lack of services and their effects on the children.

Consensual unions and cohabitation prior to legal marriage are socially accepted practices. However, these unions are unstable and short-lived, one destructive factor being the man's alcoholism. This gives rise to the sporadic presence of a number of paternal figures, leading to the affective instability of the family and the predominance of mere control and punishment. Children very often leave home and have a life cycle of living on the streets, at home and in rehabilitation institutions. The size of the family unit is large, and high value is attached to children as a supportive factor; there is some knowledge of contraceptive methods, although their use is less frequent than in other urban sectors.

(e) The family unit of office workers

The family unit described below is typically that of office workers, whether in the public or private sector, whose jobs do not involve managerial responsibility. Their characteristics may be generalized to cover employees in commerce with stable jobs. This is the large mass of white-collar workers which has grown up due to State job creation, the growth of the demand for social services (health, education, housing, social security) and partly from the modernization of the economy.

These family units are predominantly urban and at some stage in the family life cycle have, through the intermediary of a mortgage institution, acquired a solid dwelling which ensures some privacy for each member. They have water, electricity and sanitary facilities within the dwellings, and

/they are

they are almost fully equipped with consumer durable goods and domestic appliances. Their income is entirely in money form, and is earned both by the head of household and his wife, who works in some kind of paid job, also as an office-worker or saleswoman, whether temporarily or permanently, full time or part time. The total money income is enough to permit an economic rationale based on some kind of budgeting. The percentage of total income devoted to food is lower than in the other types of family units, and the proportion devoted to other purposes and to hire-purchase is a good indicator of the needs and aspirations of these units.

Regular working hours, the enjoyment of at least one and a half free days a week, the type of housing and the household fixtures and appliances make domestic work easier, although no less routine. It is always the responsibility of the woman. The man may do it from necessity or out of goodwill, but it is not his responsibility. The children carry out small domestic tasks, more as a form of apprenticeship and discipline than out of necessity.

As a general rule, there are stable family units resulting from a formal union which is not entered into at a very early age, and they rarely have more than three children.

They are fully exposed to the mass media (radio, television, newspapers, magazines, street advertising) and are thus in possession of news of all kinds.

Through their trade-union organizations or the public infrastructure they have access to education and health services at relatively low prices. Usually, however, they consider these to be of low quality and if they could afford it they would use private services.

The man continues to be considered the head of the household, an image reinforced by a whole series of daily events (sitting at the head of the table, first to be served at table, treated with respect, etc.); however, there is a considerable amount of equality and comradeship in the relations between the spouses and between them and their children.

/The horizon

The horizon in the project of these units is to own their own homes, to achieve the highest possible level of schooling for their children, who it is hoped will obtain university degrees, social security ensuring some economic security in old age, and a gradual improvement of household fixtures and fittings. It is highly probable that the children, both boys and girls, will in turn form family units which are the same as, or very similar to, those from which they come.

Although reproductive domestic work is relatively light due to the possession of consumer durables and domestic appliances, and in some cases the woman may even be helped by paid domestic assistance; it is nonetheless routine. If she works away from the home either permanently or during full days, she usually calls on the help of relatives (mother or sister) to care for the children.

As was pointed out above, the regular working hours of this type of family unit allows more frequent contact between parents and children. In any event, here again there is some form of specialization of activities according to the sex of the parents. It is the mother who helps with school work and with whom the children can talk freely on any topic. The father is usually a more aloof figure, more connected with the family's external relationships than with its internal life. Thus the sexual stereotypes tend to survive, despite the weak real basis for them in the family's living conditions.

Broadly speaking, the children of these families have an acceptable level of nutrition and, in good time, catch the normal succession of childhood illnesses. The infant mortality rate is low. It is unusual for children from such families to be abandoned, beggars or delinquents. Their access to the formal educational system is relatively normal and they remain at school as long as their personal abilities or the family's economic situation permit. As a rule, they complete their secondary education. If the family's economic situation only allows for some children to go to university, preference will be given to the male children.

/The training

the training they thus receive fits them for jobs similar to those of their family of origin. If they obtain a university degree they will have difficulties in professional life due to the lack of suitable social relations on the part of their original family units and the necessity of participating in a world whose norms of conduct and values they do not know.

(f) The situation of the family in the Caribbean

It is impossible to give a brief summary of the many family forms coexisting in the Caribbean, whose origins lie in the relationship between the different islands and the various central countries which colonized them, the different types of agriculture implanted, the successive waves of immigration designed to solve the problem of the shortage of labour under different legal forms (African slaves; contractual European, Chinese, Javanese and Indian labourers; Amerindian, Portuguese and Jewish immigrants) and emigration, which all affect the different social groups in a varying degree.

The abolition of slavery did not signify the real disappearance of the plantation system, which in fact survived in many districts as a result of bonded labour, compulsory servitude while paying off indebtedness and other forms of wage-earning labour which were formally free but were in fact linked with forms of slavery, in economies without many employment opportunities outside the plantations. This situation gave rise to seasonal work patterns which have affected family organization.

In this context it is easy to understand that the land has more of a social and mythical than an economic value. During slavery, the land represented social status. During emancipation, land was a symbol and indeed the realization of freedom. At present, it is the place where one's forefathers are buried, and also the only source of security for the relationship between husband, wife and children.

There are at least three types of land tenure in the case of smallholdings. One is the family plot, inherited from one's forefathers, owned by and handed down to the entire family, and held in trust by one member of the family. This land is inalienable, and family members have the right to claim their part of the harvests even when they reside in the city, and to return to live on the family land even when they have been absent for many years. Another form is the land purchased by a man or a woman which is

/theoretically not

theoretically not subject to any restriction as regards sale or transmission. In practice it is handed down to all the children or to one of them, and thus after one or two generations a third form arises; inherited land which is not family land but which in one or two generations begins to take on the character of family land. Since in common law both bilateral or unilateral descendants inherit property without discrimination by sex or primogeniture, the process of individual division is accelerated when siblings own the land jointly and their children all inherit it.

In the great cultural mosaic of the Caribbean, there are common features which characterize the rural and urban lower-class Creole family of the English-speaking Caribbean. However, it should be borne in mind that these are societies in which social stratification is based on wealth, education and colour, with a long history of slavery in colonies whose metropolitan countries had different languages, religions and social structures, and with a variety of different constituent populations; consequently the rural and urban lower-class Creole family organization described below is one of many coexisting forms of family organization. Nevertheless, it seems to have sufficient strength to have spread to other lower-class ethnic groups, including those with a strong and very different religious basis, such as the Indians.

The patterns of unions have a typical sequence. A young man begins to visit a young woman at her home. The latter's family, willingly or unwillingly, often brings up the children of these visiting unions, while the mother goes into domestic work in the city. After one or more of these visiting relationships, the couple without any ceremony form a consensual union known as a "keeper union", "common-law marriage" or "faithful concubinage". It is frequently the woman who owns or rents the home and the household includes her children by earlier relationships. These consensual unions tend to be lasting. Formal marriage may be the culmination of such unions, but often does not take place until quite late, when the couple have become grandparents or there is a danger of death. In any case, formal marriage is postponed until the man can pay for building or buying a house, and is capable of keeping a woman so that she no longer needs to work away from home. Thus formal marriage is a proof of social, economic and personal maturity.

/The material

The material conditions (infrastructure services, housing, nutrition, etc.) of these unions are no different from those of the poorer strata in the rest of the region, although perhaps particularly associated with employment problems. The emigration of the young men, primarily to other countries, in search of jobs and incomes is reflected in the low number of men, which paves the way for the sequence of unions described above and the family organization centred on the woman.

Children are viewed as a blessing and a proof of virility, which, given the pattern of unions described above, leads to a high number of children per woman. Illegitimacy is frequent but not shameful, and the situation is often remedied by the subsequent marriage of the parents. In addition, since the sequence of unions is normally accepted in social life, there is no judgement of illegitimacy based on the identification of the family with marriage and of kinship or family with conjugal relations.

Men and women spend little time together away from work. The relations between parents and children, and particularly between mothers and children, are more durable than relations between marital companions. Young men continue to depend on their mothers until 20 or 30 years of age, and in some communities do not think of forming a consensual union while their mothers are still in a position to care for them. The husband and father has complete authority in the home; the consensual unions tend to be more egalitarian than the legal marriages. The woman can always rely on the support of her children. The man can count on them only if he regularizes his situation with the woman.

In the consensual unions women are independent agents and take the important decisions regarding the children, jobs, etc., supported by their own relations. The relations on the husband's side play a smaller part.

Many of the children are brought up by women; mothers who look after their children without regular male support; grandmothers who bring up their daughters' children; legal or consensual spouses whose husbands are temporarily or permanently absent. It is accepted that bringing up children involves physical punishment.

/It is

It is also accepted that the man should give proof of his authority over the woman, which does not exclude the use of physical punishment. As regards the sexes, there is clearly a double standard: girls must be virgins, boys sexually adventurous; women must be monogamous, while husbands are free to have a number of unions. The droit du seigneur is still in force in gaining employment or promotion.

C. POLICY GUIDELINES

1. Differences in priorities according to family situations

The different family situations are associated with different forms of internal organization of the unit for social production and the reproduction of agents, the division of work among its members, the distribution of resources and the relationships of the unit and of its members with society. Obviously, each family situation, and the ensuing life strategy adopted by the unit to achieve its goals, establishes different needs and thus different priorities for the policies designed to remedy this situation. To establish these priorities and define the corresponding policies calls for an understanding of the causes of the situation, its consequences for the unit and each of its members and the possibilities of action to change it.

Thus the policy priorities of the family of the small agricultural producer, for example, would be different from those defined by the family unit of the agricultural labourer. In the first case, top priority would be attached to measures to formalize unions, regulate inheritance practices or provide women with the right to own land, all of which are measures aimed at avoiding the formation of minifundios and, ultimately, the disappearance of the family unit. In the second case, priority in policy and action would probably be attached to improving the housing conditions of the families or increasing the capacity of women to act as household heads.

It may readily be seen then, that only a suitable understanding of the family unit and its elements and relationships will make it possible to identify possible action and policy priorities both for the family as a unit (i.e., the family organization) and for its members (women, children).

2. Basic information for policies

Whether the family is viewed as a policy target group or a strategic group for policies, the information needed is both quantitative data and information on relationships.

The sources of quantitative information are basically the censuses and household surveys. It should be borne in mind, however, that these sources gather data on individuals which must be reprocessed in such a way as to enable the latter to be linked with the family units to which they belong. Along these lines, a start has been made at keeping family unit records. If such records become available, it would be possible to analyse the structure, composition and number of members of the family, by sex, age, education, on the basis of the characteristics of the heads of the unit (occupation, education, income) and of the units themselves (zone of residence, type of housing, infrastructure services).

The sources of information on the internal and external relationships of the family unit may be specially designed surveys or else the anthropological research methods used to discover the specific rationale underlying the relationships analysed.

In any case, it must be stressed that both these types of information are necessary in order to grasp the features of the family as organizational units, and that once a type of action has been decided upon, the family units whose situation is to be altered should be included in all stages of programme design and implementation.

3. Some considerations on policies aimed at lower strata families or their members (children, women)

Policies designed to improve the housing, educational, health or nutritional conditions and reduce numbers of children, whether global or specifically destined for the lower strata, have been analysed most thoroughly; a number of studies exist on their effects, possibilities and limitations. On the other hand, little or no attention has been paid to the policies designed to affect the family organization of the society, meaning the family life cycle (ways in which couples are formed, formalization, duration and stability of unions), the conditions of each stage in that cycle for the
/different members

different members of the unit and the relationships among those members and between them and the unit and the global society. Some of the problems which must be taken into account in these policies refer to the situation of women who are de facto virtual slaves engaged in domestic work, some other job which allows them a small income and reproduction; the situation of men, who have failed as economic providers for their families, which is the role society allocates to them, and confined within the limits of machismo; the situation of the children, who work from an early age, and are brought up in these conditions.

The policies designed to affect family organization should take into account that the goal is to maintain or modify relationships (husband-wife, parents-children, nuclear family-kinship network, family unit-global society), which calls for not only the relevant information but also the conceptual framework for understanding the different forms of organization, their meaning in a specific situation and the connexions between the organization of relationships and context in which they occur. In any case, a national policy on the family must take account of a wide variety of situations.

Some examples of policies will serve as an illustration of the problems which must be considered when attempting to alter the family organization of the lower strata:

(a) Raising the age of unions. It is implicitly assumed that the age at which unions are formed depends on the voluntary and rational decision of the individuals concerned, without clearly recognizing that, since it is a generalized and socially regulated form of behaviour it must in some way be a means of satisfying affective and sexual needs and of organizing life strategies. By raising the age of the first union, the goal is a better socialization of the children who will be brought up by more stable couples, since they will have formed their union at a more mature age; a smaller number of children, by reducing the time available for pregnancy, which will in turn lighten the domestic burden of women; and more time for the couple to dedicate themselves to training or, in the case of the woman, to paid work.

/These proposals

These proposals, however, barely stand up to a comparison with the facts, particularly when dealing with the poorer sectors of the population. While it may be possible to accept a direct relationship between age and personal maturity, the relationship between the age of the first union and its stability is not as clear, and still less the relationship between the stability of the union and the better socialization of the children. Again, there is no very clear relationship between the age of the first union and the number of children in sectors of the population where more or less free and early sexual relations go hand in hand with ignorance of and/or lack of access to contraceptive methods. Finally, the poor sectors of the population have a marginal participation in the educational system and in the job market, and therefore to raise the age of the first union will not have any significant effect. The imposition of a minimum age for marriage and raising the educational requirements for getting work are, in themselves, measures of little or no effectiveness in relation to the poor.

(b) Formalization of unions. These policies start from the assumption that formal unions establish more precisely the rights and duties of the couple and their children, which should lead to more stable unions, responsible parenthood, a better situation for women and children, and lower illegitimacy rates. The measures taken for this purpose, such as preference in the granting of credit, housing, children's dining rooms, etc., to formal unions are in themselves, and in the best of cases, only relatively effective. The union is formalized but continues to be governed by the prevailing norms and customs which establish the obligations and duties of the parties. In addition, the effectiveness of the measures is affected by the fact that the poor do not have the money to formalize their unions, are not aware that they can do so free of charge or do not possess the necessary administrative and police documents (birth certificates, identity cards, etc.). Finally, many poor people do not have access to the services from which they would receive preferential treatment even if their union were in fact formalized.

(c) Stability of unions. It is assumed that stability would make it possible to reduce the number of children per woman, since women tend to have children from each new union; improve the socialization of children by the greater permanence of both parents and the mutual accommodation between them as the result of more

/lengthy mutual

lengthy mutual dependence; and avoid the possible conflicts arising from the existence of children from successive unions. The instability of unions as a social pattern and widespread form of behaviour tends to occur in social sectors where the man does not have stable work, relatively close to home and with an adequate income, and where the woman depends on the presence of a man for the maintenance of herself and her children and/or for reasons of security and social status. Consequently, to achieve a greater stability of unions in the poor sectors it would seem more effective to attack the causes of these circumstances than to take educational or legal measures establishing the equality of the partners during unions or at the time of their dissolution, or the impossibility of formalizing new unions.

(d) Reduction of illegitimacy rates. These policies are related to those aimed at formalizing unions and at avoiding the problem of unmarried mothers, multiple unions or informal polygamy. Their aim is to establish paternity exactly, in order to ensure that responsibilities as concerns inheritance rights are fulfilled. These policies are of doubtful effectiveness when those responsibilities are difficult to fulfil and still more to enforce legally, or when the legislation governing inheritance differs from entrenched custom, or when there is nothing to bequeath.

(e) The situation of women. These policies may be implemented in a variety of sectors (education, health, housing, etc.) through a wide variety of measures, as may be seen from the world and regional plans of action drawn up for this purpose. The objectives of these policies may range from the elimination of sexual discrimination in the educational and economic spheres to the recognition and social valuation of the activities undertaken by women and to political participation. Some measures aimed exclusively or primarily at women (mother-child care, training in the making and marketing of handicrafts, etc.) may be beneficial to them and their families as well, and can be implemented more or less independently of family living conditions. On the other hand, other measures will have few results if they do not take account of those living conditions and also of the possibilities of tackling them with the national resources available. For example, policies aimed at raising educational levels imply that the family must possess sufficient

/income to

income to allow the children to enrol and remain in the school system, as well as the possibility that the woman should have some free time at her disposal. Given job market conditions and the responsibility for domestic work, which is a heavy burden due to the lack of specific goods and infrastructure services, it is unlikely that poor families will be in a condition to attain these minimal requirements. Consequently, the policies designed to improve the situation of poor women and integrate them into the development process must take into account that their lives are inseparably linked with the living conditions of their families and the responsibilities within the family which society attributes to them.

(f) The situation of children. For emotional reasons as well as for their future consequences, these possibilities have the greatest probability of receiving support, particularly in the case of policies aimed at achieving suitable levels of nutrition, education and health. The effectiveness of these policies depends on whether families prevent their children from having access to these services due to their need for the children's contribution to income or domestic work, and whether the services manage to cover the children who are left to their own fate, vagrants or beggars due to the lack or absence of parents.

(g) Husband-wife relations. These policies have little probability of success in the case of poor couples who have reached their thirties and have a number of children. The groups which such policies should address are primarily adolescents and new couples. However, their results are doubtful since they are usually based on educational measures, while there is no change in the structural framework which determines the time the partners spend together, the minimal privacy for sexual relations or inter-personal communication, the separation of sexual roles which defines relatively isolated spheres of decision and activity.

These structural conditions should also be taken into account in policies aimed at improving the relations between parents and children. The pattern of an absent father whose status has been devalued, an intro-punitive mother and a large number of children appears to be frequent in poor families. Attention has repeatedly been drawn to its consequences for the socialization of the children, and the existence of violent and illegitimate domination in the

/family which

family which lead to a dissociation of power from morality, and lack of communication between generations. These aspects do not depend merely on individual characteristics but are deeply rooted in the living conditions of the family.

(h) Connexions with the global society. These policies are designed to improve the access of poor families (as families) to different classes of goods and services (housing, health, infrastructure services, etc.). In policies of this kind the nature of the relations between the families and the administrative bodies is of great importance. Aspects of these relations which should be taken into account includes: (i) the organization of the beneficiary group, since the policy approach may be through individual family units or through the organization of families in local associations (community or neighbourhood associations) to structure the demands and combine their resources; (ii) the duration of the policy, which may be a specific action (delivery of food or medicine), periodic action (visiting dispensaries or social workers on a regular basis) or continuous action aimed at establishing stable links between the families and their local associations and the public services; (iii) the flexibility of policies, which may provide a specific good or service in a fixed manner, or respond in some way to the needs of families, or involve the active participation of the local family associations in their formulation and implementation. The choice of one or another type of these relations will have direct consequences on the mobilization and participation of the families and their members in society, which define the organizational model being implemented which may range from static (specific, rigid policies given with individual families) to mobilizing policies (continuous, flexible and dealing with family associations), passing through a wide range of intermediate possibilities.

4. A minimum core of measures

Bearing in mind the concrete cases described in part B, section 3, and the review of various policies in the preceding section, it may be suggested that a policy designed to improve the situation of poor families should consist of the following minimum core of actions:

/(a) The

(a) The provision of stable employment, with an adequate minimum income and a place of work close to the family unit, for the head of the household (male or female). The adequate minimum income at least reduces the need for other members of the family, particularly children, to enter the job market early and with insufficient skills, and at the same time drop out of the educational system. Stability of employment reinforces these effects. Work close to the family unit avoids the need for migrancy, with its sequel of fatherless households.

(b) Programmes of health, housing, education and basic infrastructure services (electricity, water, etc.). These improve the living conditions of all members of the family, but particularly women, since they enormously lighten the burden of domestic work and open up possibilities of their undertaking a series of activities in other areas of social life (education, work, etc.).

(c) Programmes of mass family education, specially designed to raise the level of information and communication of the members of nuclear units and combat sexual stereotypes. These programmes are specially destined for young people, beginning with primary education. In addition to their own ends, they reinforce the effects of the above-mentioned policies, and in the long term will influence family relationships.

(d) Programmes to organize families in neighbourhood or community associations, so that they can present their demands in a structured manner to the various State services, and so that the latter can find valid interlocutors among the population, while encouraging the participation of women in these associations.

(e) Adoption of legislative measures to support the objectives of the above programmes.

The core of measures is considered a minimum because the lack of any one of them would leave intact the economic limitations which condition the family organization of the poor, or the normative and ideological components of that organization, or their particular form of connexion with the global society, as has repeatedly been recognized.

/In addition,

In addition, however, it is considered a minimum because the governments of the region are, to a greater or lesser extent, implementing policies in almost all the above directions and allocating human and financial resources for those purposes. The creation of a ministry (or a similar-level body) for the family, with special departments dealing with the status of women, children and young people, responsible for research, information, co-ordination, and the formulation and execution of policies, would not call for an undue amount of new financing and might be useful to co-ordinate and increase the rationality of activities by integrating them and avoiding the duplication of effort. Co-ordination of this kind would also allow a better use of international assistance, although it remains important to insist that the different bodies providing technical or financial assistance should increase their mutual co-operation and co-ordination.

5. How to secure the participation of the groups at which the policies are aimed

The decision to do something on behalf of poor families or certain categories of their members (women, children) leaves the problem of what to do and how to secure the participation of the groups concerned.

A series of questions must be asked about whether poor families perceive their problems and the consequences for their members and society. If they do perceive that problems exist, it remains to be seen what those problems actually are. Then it must be determined whether the problems perceived are the same as those defined in the studies by economists, sociologists, planners or decision-makers.

It will become relatively easier to act only when the problems perceived by the family units coincide with the problems defined by the corresponding official bodies.

However, bearing in mind the particular situations described above, it would appear that any attempt to design a uniform national policy should be rejected out of hand; even if the objectives are the same, the necessary action will differ in the various situations of the family unit.

/Isolated, specific

Isolated, specific measures and programmes designed to improve the situation of families, children and women are better than nothing, but they will only be fully effective if they are validly integrated in local, regional and national development plans.

The creation of machinery allowing fluid communication between planners or policy-makers and the population at the various stages of the formulation, execution and evaluation of plans or policies is an essential measure to avoid any impression of manipulation and achieve a modicum of effectiveness in action. However, communication of this kind would appear to be a rather distant target, given the styles of development which predominate in the region.

1. The first part of the document discusses the importance of maintaining accurate records of all transactions and activities. It emphasizes that proper record-keeping is essential for ensuring transparency and accountability in the organization's operations.

2. The second part of the document outlines the various methods and tools used to collect and analyze data. It highlights the need for consistent data collection procedures and the use of advanced analytical techniques to derive meaningful insights from the data.

3. The third part of the document focuses on the role of technology in data management and analysis. It discusses how modern software solutions can streamline data collection, storage, and processing, thereby improving efficiency and accuracy.

4. The fourth part of the document addresses the challenges associated with data management, such as data quality, security, and privacy. It provides strategies to mitigate these risks and ensure that the data remains reliable and secure throughout its lifecycle.

5. The fifth part of the document concludes by summarizing the key findings and recommendations. It stresses the importance of ongoing monitoring and evaluation to ensure that the data management processes remain effective and aligned with the organization's goals.

III. SOME TYPES OF POOR LATIN AMERICAN
WOMEN

CONTENTS

	<u>Page</u>
Introduction	105
A. THE EDUCATIONAL, OCCUPATIONAL AND INCOME SITUATION OF WOMEN IN LATIN AMERICA	105
B. A TYPOLOGY OF POOR WOMEN	118
1. The rural housewife	120
2. The female agricultural worker	121
3. The urban housewife	124
4. The female manual worker	126
5. Housemaids	127
6. Native street vendors	129
Conclusion	131

1. The first part of the document discusses the importance of maintaining accurate records of all transactions and activities. It emphasizes that this is crucial for ensuring transparency and accountability in the organization's operations.

2. The second part outlines the various methods and tools used to collect and analyze data. This includes the use of surveys, interviews, and focus groups to gather qualitative information, as well as the application of statistical software for quantitative analysis.

3. The third part describes the process of identifying trends and patterns in the data. This involves comparing results across different time periods and departments to gain a comprehensive understanding of the organization's performance.

4. The fourth part details the steps taken to address any identified issues or areas for improvement. This may involve implementing new policies, providing additional training, or restructuring certain processes to enhance efficiency.

5. The final part of the document provides a summary of the findings and offers recommendations for future actions. It stresses the need for continuous monitoring and evaluation to ensure that the organization remains on track with its strategic goals.

Introduction

Since International Women's Year and during the subsequent United Nations Decade for Women, studies on the situation of women in the world have proliferated. Some of these studies have tried to cover the whole wide range of phenomena of discrimination which affect women, but latterly attention has centred on certain topics such as education, employment and income. This new orientation has meant that the analyses are increasingly objective and measurable and also make it possible to locate women in the context of their respective social strata and appreciate the diversity and complexity of such strata.

In this work it is proposed, in addition to examining some background details about the aspects of Latin American women in question, to formulate a typology which will take account not only of their differential characteristics in comparison with men but also the social aspects underlying sexual differences, and will give a picture of the characteristics of women from the lower occupational strata.

A. THE EDUCATIONAL, OCCUPATIONAL AND INCOME SITUATION OF WOMEN IN LATIN AMERICA

Reference has been made to the improvement of the level of education of women during the present decade in Latin America. In spite of this, however, the differences between male and female educational levels have tended to persist, and it is only from 1970 onwards that efforts may be observed aimed at reducing the distance between men and women in this respect.

The UNESCO figures regarding school enrollment in Latin America at the basic, secondary and higher educational levels show the evolution in this respect for the period 1960-1975 (see table 1).

It can be seen from this table that the biggest increase during the decade was in enrollment in higher education, especially from 1970 onwards, when enrollment by women was three times the figure for 1960. Even so, female enrollment at this level in 1970 was still only 37% of the total students enrolled. At the basic level, the indexes of growth of female enrollment were almost equal to those for men (see tables 2 and 3).

Table 1.

LATIN AMERICA: INDEX OF GROWTH OF ENROLMENT BY EDUCATIONAL LEVEL AND SEX, 1960-1975

(1960 = 100)

Year	Total		Level 1		Level 2		Level 3	
	Both sexes	Women	Both sexes	Women	Both sexes	Women	Both sexes	Women

/The biggest

The biggest pressure for gaining access to education has been at the secondary and higher educational levels, and the middle sectors have been those most favoured by the expansion of the educational system.

At the same time, however, in spite of the increase in enrollment, the orientation of women's higher education has not varied substantially during the decade. Women continue to choose courses which are simple an extension of female roles in the household and are characterized by shorter duration and hence lower cost.^{1/}

Another interesting aspect is that the expansion of education has reached sectors which will subsequently either not enter the labour force or not remain in it for long. In this way, the social reproduction character of education has been intensified, i.e., sex divisions in employment and discrimination against women in society have been maintained,^{2/} since this "educated" sector will mainly carry out the traditional functions of mothers and wives.

It is evident that the educational dimension displays greater elasticity in the face of social pressures than employment or income. Education is the social good which is "cheapest" to distribute without adversely affecting the stability of the basic social institutions and the prevailing order. In purely economic terms, for example, expanding basic education costs less than setting up industries which will offer adequate employment opportunities, and it is still more difficult to secure a more equitable distribution of income.

Moreover, in certain cases such as those of many professional women, for example, even when higher educational qualifications have been obtained they are not used continuously and to the full. For men, in contrast, the greater access to education is reflected in an increase in the educational qualifications required to gain the same jobs.

^{1/} The courses preferred by Latin American women are arts, education and nursing. See table 1 of Marshall Wolfe's paper "La participación de la mujer en el desarrollo de América Latina", in CEPAL, Mujeres en América Latina, Fondo de Cultura Económica, Mexico City, 1975, pp. 16-17.

^{2/} M. Teresita de Barbieri, "La condición de la mujer en América Latina: Su participación social: Antecedentes y situación actual" in CEPAL, Mujeres en América Latina, op. cit.

Female participation in the labour force has increased in Latin America in recent decades 3/ (see tables 4 and 5), thus helping to secure greater economic development. Various studies have shown the importance of education in the decision to enter the labour market,4/ so it is easy to see that the female population with more education is that which participates in this market most.

Although the educational level of the female population as a whole is below that of the male population, the situation is reversed in the case of the economically active population, as may be seen from table 6.

This table gives grounds for assuming that, in order to win jobs in competition with the male population, women must have higher educational levels than those of men.5/ Most women do not even compete in the same labour market as men but in a parallel market, also some times called the

-
- 3/ A woman with university education has three times as many chances of being employed as a woman with less than four years of primary education, according to Sylvana Sada Maccan and Michael Bamberger, "Employment and the Status of Women in Venezuela" in Development Digest, Vol. XIII, N° 3, July 1975.
- 4/ Demographic studies have paid preferential attention to the factors determining the entry of women into the labour market, with particular reference to the influence of age, marital status and number of children. See in this respect Víctor Gómez, Argentina, Costa Rica, México y Venezuela: Algunos resultados de las encuestas comparativas de fecundidad en América Latina relacionadas con la participación femenina en actividades económicas, CELADE, Santiago, Series C.N/145, 1972; Angel Fuccaracio Desarrollo económico y social, participación de la fuerza de trabajo y fecundidad, research outline, CELADE, Santiago, 1973; María Eugenia Baltra, Participación de la mujer en actividades económicas en Chile (1960): Un análisis de las variables demográficas en particular la fecundidad, CELADE, Santiago, 1971; Aída Rodríguez y Susana Schkolnik, Chile y Guatemala: Factores que afectan la participación femenina en la actividad económica, CELADE, Santiago, 1974; Ana María Rothman, La participación femenina en actividades económicas en su relación con el nivel de fecundidad en Buenos Aires y México, CELADE, Santiago, 1967, and Juan Carlos Elizaga, "The participation of women in the labour force of Latin America: fertility and other factors", in International Labour Review, Vol. 89, Nos 5 and 6, May-June 1974.
- 5/ See in this connexion Gunvor Velagapudi, La mujer y el empleo en América Latina, PREALC, Santiago, Working Document N° 99, June 1976.

^{a/} Whenever the whole of Latin America is not being considered, the phenomenon will continue to be illustrated with data from these five countries (insofar as information is available), since in one way or another they represent different styles of development of the region.

/informal market,

informal market, where they seek "women's" occupations,^{6/} In partial corroboration of this assertion, it may be observed that in Latin America the occupations which absorb the largest amount of female labour are those of the services sector, as shown in table 7.

Although the Latin American countries compared in the table have different development styles, there are no great differences as regards the percentages of the economically active population located in what has been called the lower strata of tertiary activities. The difference between the sexes in this respect is very marked and has not change substantially during the decade, although the proportion of wage-earning women in this category has tended to go down very slightly.

The statistical data also show an increasing proportion of women in the middle and upper strata, especially as self-employed professionals, employed professionals, technicians, saleswomen and the like.

The fact that over a third of the female economically active population remains in the lower strata and in the services sector, especially domestic service, is explained partly by the entry of the middle and upper sectors into the labour market. In order to be able to work, a woman from the middle or upper sector must free herself from her domestic tasks, so that the availability of domestic servants is one of the requisites for her entry into the labour market.^{7/}

It is interesting also to note the different wages received by men and women. It is generally agreed that women are discriminated against in this respect.^{8/} Attempts are made to justify this difference by arguing

^{6/} For Venezuela, the 1941, 1950 and 1961 censuses show that in each case at least 70% of women work in occupations in which they are over-represented. In none of these censuses did they amount to more than 18.7% of the labour force, but in each case at least 60% of employed women were working in occupations in which women represented more than 76% of the labour force. See Maccan and Bamberger, op. cit.

b/ The category "others" covers 42% of the total, so it was not considered.

/that women

that women are less trained, assume less responsibility in their work, work in smaller enterprises, are generally younger than male workers (because they leave the labour market when they have their first child), are grouped in a limited number of occupations, and actually work for a shorter time because of their domestic commitments.

To sum up, then, women would appear to work in occupations which are less attractive, more humdrum and less well paid. It should be borne in mind, however, that the employment of women in certain types of industries, such as the electronics and textile industries, is due not only to the fact that they represent cheap labour, but also to their special gifts for carrying out certain types of tasks. Even if we accept the reasoning of the employers, it would be necessary to make a more profound analysis of this reasoning, and in this respect we should bear in mind both the different class situations which are conditioning the education received and also the effects of socialization, the values of which highlight the positions of housewife and mother as suitable functions for women.

Perhaps the discussion would be more interesting if it were possible to distinguish between the effects caused by the demand and the supply of female labour. The supply would appear to be dictated by general factors such as the growth and age structure of the population, geographical location, family composition, the socialization and values of both women and their family groups regarding female labour, and the level of income received by the family. It should be borne in mind that in the case of women from the lower strata there is a strong compulsion and need to enter the labour market when their family situation is unstable, as in the case of unmarried mothers, abandoned wives, widows, separated women, etc.

The demand for female labour, for its part, would appear to depend on the general development conditions and the structure of the economy. In this respect, it is suggested that in societies where agriculture is the basic economic sector, the share of women in the labour market is likely to be greater than in societies with a higher level of industrialization.^{9/}

^{9/} See the discussion between Ester Boserup, "Women's role in economic development" and Suellen Huntington, "Issues in woman's role in economic development: critique and alternatives" in Journal of Marriage and the Family, November 1975.

The demand for female labour would also seem to be conditioned by the prevailing social legislation. It has been shown that greater protection (especially during pregnancy and nursing) or prohibition of certain types of work for women (such as night shifts) increase costs and discourage factory owners from hiring female labour, in view of women's lower productivity and their frequent absences from work due to domestic commitments.

Only in a few cases, however, has attention been paid to the class differences underlying the sex differences.^{10/} An interesting study in this connexion is one carried out in Venezuela which indicates that education is one of the elements which should be taken most into account with regard to the income received. This study also indicates that the average wage of a woman with university education is 6.9 times that of an uneducated woman, whereas the similar difference between men is only a factor of 3.7. The bigger difference in the case of women must be due to the fact that, especially in the case of women from the lower strata, they enter the labour market at lower ages than men in the same situation. This state of affairs would seem likely to become more accentuated, since the occupations where women are employed have increased more, while the increase in wages (in absolute terms and in relation to men's wages) has been much smaller.^{11/}

If we consider exclusively the case of domestic servants, it is necessary to bear in mind the difficulties they face in organizing themselves and forming trade unions which will enable them to negotiate and exert some type of pressure in order to secure better wages and more favourable working conditions. The same is true of street vendors, among whom there is a large proportion of women. Moreover, the majority of working women from the lower strata are working mainly because of economic necessity.

^{10/} This raises queries such as: who is it desired to equalize women with: with men in general or with men of the same social class? See in this respect J. Graciarena, "La desigualdad...", op. cit.

^{11/} In the case of Venezuela it was found both in 1961 and in 1971 that the average male income was 60% greater than the average female income. See Maccan and Bamberger, op. cit.

rather than through a genuine desire to enter the labour force. This means that they are willing to accept any wage, no matter how low it may be.^{12/}

Unfortunately, the available information on income is scanty, of dubious reliability, and has not been broken down by sex. At all events, there is no doubt that women receive wages and salaries which are markedly below those of men and occupy posts of lower standing, although as we have seen in the case of the countries referred to, their average educational levels are higher.^{13/}

In brief, then, the information presented shows the situation of working women in Latin America as regards education, occupation and income. A review of this information brings out the need for approaching the problem in terms of an analysis of social classes rather than as a function of sex discrimination. It seems necessary to study groups of women belonging to particular social classes, which display different living situations, forms of incorporation in the system of production, educational levels and ideologies, since there is no "Latin American woman" as a global, abstract entity, but only women in different specific situations, i.e., located in structures with different styles of development and belonging to different social classes. In the following pages, an attempt will be made to formulate a descriptive characterization of some typical social situations of poor women in Latin America.

^{12/} In Greater Santiago, the income of female heads of households is markedly below that of male heads of households, because their entry into the labour market is later and is due in most cases to the death or separation of their husbands or companions. See G. Rama and N. Schlaen, El estrato popular urbano, preliminary version, Social Development Division, CEPAL, July 1973.

^{13/} See Henry Kirsch, "La participación de la mujer en los mercados latinoamericanos" in Mujeres en América Latina, op. cit., especially table 2.

B. A TYPOLOGY OF POOR WOMEN

Up to the present, a precise definition of what should be understood by poverty has been avoided. Some studies have noted the difficulty in defining the poor,^{14/} either because poverty ^{15/} is viewed from a consumerist perspective, as a specific situation, or because it is defined in relative terms, i.e., in the light of social inequalities. When poverty is considered as a situation, emphasis is placed on the existence of a group called "poor" who do not possess the resources to satisfy their basic needs. In contrast, the concept of poverty as a relative state means raising the question of social inequalities and the interdependence between groups which are poor and those which are not poor.

For the purpose of the present work, poor women will be considered as those belonging to the lower occupational strata, whether residing in the country or the city, and with a place in the labour market determined by their occupation and their occupational category. These are the most important variables which will be borne in mind. In this way, it is possible to gain an approximation to what may be called the class situation of poor women. In so far as information is available on education and income, these data will be incorporated as a means of specifying each class situation.

One of the objectives of the present work which has already been referred to is that of separating and distinguishing between different situations of poor women. The method of doing this which seems to be most suitable is that of constructing a typology which will make it possible to show the internal variations of the group on the basis of two variables: their form of insertion in the labour market and their place of residence (urban or rural). We should not lose sight, however, of the fact that the resulting types are abstractions of a much richer reality and therefore to

^{14/} See Marshall Wolfe, Poverty as a social phenomenon and as a central issue for development policy, CEPAL, May 1976, and Rolando Franco, Los problemas de la definición y mensura de la pobreza, ILPES, Santiago, November 1976.

^{15/} It has been noted that even the choice of the term "poverty" has an ideological background. See M. Wolfe, La pobreza..., op. cit.

some extent distort the real characteristics. It should also be borne in mind that this typology will not cover all the possible types, but only those considered to be most representative in numerical terms and most frequently met within the majority of countries of the region.

The layout of the properties in the typology would be as follows:

	Economic sector	Residence	
		Rural	Urban
Lower occupational strata of the activities indicated:	Not incorporated	1	2
) - agricultural	3	4
) - secondary	5	6
) - tertiary	7	8

Crossing the two variables (economic sector and residence) gives eight possible types of poor women. In order to operationalize what we have called the lower occupational strata, we have considered as poor women wage earners, unpaid family workers and own-account workers in agriculture, stock-raising, fishing, mining and similar occupations, all of which make up the type of lower strata in primary activities. Women employed as drivers of means of transport, artisanal spinners, other types of craft workers, manual workers and female day workers correspond to the lower occupational strata in secondary activities. Finally, women employed in domestic and service jobs make up the lower occupational strata in tertiary activities.

There would also be two types of women of the poor strata who do not work and whose qualification as poor women would be defined by the occupational status of the husband. Such is the case of the majority of women who are theoretically of working age, since female participation in employment in 1975 only came to 19.6%, according to ILO estimates (see tables 4 and 5).^{16/} Let us first of all analyse the case of rural housewives, who at first sight seem to offer a more homogeneous set of characteristics than those presented by urban housewives.

^{16/} According to ILO, Latin America is the region which shows the smallest percentage of female participation in employment, but it should be borne in mind that statistics for other regions such as Africa and Asia take into account domestic work and the agricultural activity of women. The over-representation of female labour in the courses has been extensively recognized in Latin America.

1. The rural housewife

This type is generally not found in its pure form, since the mothers, wives or daughters of peasants are also brought into agricultural work on a seasonal basis or as what may be called an extension of household work.^{17/} This covers such activities as taking care of small kitchen gardens, grinding corn, fetching water from the well, and collecting firewood, fruit or herbs, all of which tasks are carried out in addition to the household work proper and the work of bringing up the children.

For the most part, official surveys omit the productive work carried out by women in rural areas, treating it in most cases as domestic work of no economic value.^{18/}

The situations of life and organization of household work of rural women who do not carry out social work would therefore depend on the place of the male head of the family (father, husband or son) in the productive system. Tentatively, a distinction could be drawn between the situations of wage-earning agricultural labourer, smallholder, sharecropper on a big estate, bonded labourer, or, finally, a combination of the first two categories.

Moreover, they could be grouped according to whether they form part of what may be called a "traditional" system of land tenure or a "modern-capitalist system".^{19/} Outstanding in the first group are the bonded

^{17/} In this sense, it is important to take into account the difference between household work understood as that which is carried out in the dwelling unit for the consumption of its members or the maintenance of the unit, and social work, which is defined by exclusion as all kinds of work which are not household work. See Carlos Borsotti, "Notas sobre la familia como unidad socioeconómica", Revista Paraguaya de Sociología, Vol. 13, N° 36, May-August 1976.

^{18/} For a discussion on the economic value of household work, see Elizabeth Jelin, "La bahiana en la fuerza de trabajo: actividad doméstica, producción simple y trabajo asalariado en Salvador, Brasil", in Demografía y Economía, N° 24, Vol. VIII, 1974.

^{19/} This distinction is based on the fact that the long-term historical trend has been towards the growing monetization of productive activities and the progressive loss of importance of domestic production: there are no valuational overtones in the use of the terms "traditional" and "modern". See, in this connexion, CEPAL, Las transformaciones rurales en América Latina: ¿desarrollo social o marginación? Serie Cuadernos de la CEPAL, N° 26, 1979.

labourers on large estates and the smallholders and, within the second group, the wage-earning agricultural labourers.

In the case of the bonded labourers and the smallholders it may be assumed that the women sporadically carry out domestic work in the houses of the landowners and also take part in agricultural activities at times when there is greatest demand for labour, in view of the seasonal nature of the crops grown, i.e., during harvest time, the fruit harvesting period, the wine harvest, and so on.

In the second case, the wife or daughter of the wage-earner also takes part in productive agricultural labour, in the production of goods or in paid household work. The census information shows differences between countries, however, with regard to the participation of labour in the primary sector, and also in the case of women (see table 8).

From this information, it may be inferred that the majority of women who live in the country do not carry out a productive activity which is reflected in figures in the censuses, and in this sense it is perhaps with justice that agriculture is referred to as a male productive activity.^{20/}

Bearing this situation in mind, no special account will be taken of the type of woman who lives in the country and works in the primary sector, although it should be noted that the total workload to which she is subjected is considerably greater (apart from her work in the fields, she also has to carry out her household tasks) and that the rudimentary nature of household facilities and fittings makes the execution of household tasks more difficult.

2. The female agricultural worker

The group of women of the lower strata working in the primary sector is numerically the smallest. They are generally own-account workers or unpaid family workers, the proportion of wage-earning women being very small (see table 9). Furthermore, they also show the lowest educational levels.

^{20/} See some criticisms of this concept in R. Iturra, B. Iturra and N. Tapia, Exploración sobre la situación de la mujer en la agricultura, Working Document N° 1, Centro de Estudios Agrarios y Campesinos, Universidad Católica de Chile, Sede Regional de Maule, Talca, July 1973. a/ No data given in these columns for lack of sufficient information.

In the selected countries, their average level of education did not bring them any higher than functional illiteracy, except in Argentina, where the level was equivalent to that of four years of schooling in 1970 (see table 10).

It should be stressed, especially in the case of rural women, that the consideration of women apart from their family unit may lead to errors. It is in the rural family that both the division and complementarity of roles are seen most clearly, and the poor rural family is also a small production unit in which each member has well-defined functions according to sex and age.

3. The urban housewife

The difficulty of finding common patterns for poor urban women who do not work makes the analysis of their situation more complex. At all events, note may be taken of the heterogeneity of their living situations and the difficulty of considering them apart from their family of origin and of procreation. Clearly, any attempt at systematization must include these factors, in addition to the diversity of social strata to which they belong. In this respect, two extreme cases may be cited by way of example: that of the marginal slum dweller and that of the wife of a worker in the modern secondary sector. Between these two cases there is a wide range which may be considered to represent the poor urban woman who does not participate in the labour market.

In spite of these reservations, however, some common aspects can be identified. One of these is that their position as housewives and mothers of a family presupposes a series of well-established functions. In this case, the difference between household work and the production of goods and services for the market is clearer. They are responsible for all the household work, and this is accepted as an unavoidable obligation. This household work, generally of a routine nature, has been learned by observing the activities of the woman's own mother. Possible innovations are due only to school influences (if there is a certain minimum level of schooling), and to the influence of the mass media such as radio and television. Some influence may also be exerted in this respect by communication with other housewives and the exchange of common experience.

Table 10

Average for EAP	5.1	7.1	4.9	5.8	2.7		2.6			2.0

a/ No data given in these columns for lack of sufficient information.

Another fundamental aspect of the situation of this type of urban housewife lies in the fact that the income received by the husband, father or companion is not sufficient to take care of the minimum requirements for food, clothing and housing, and the possibilities of making ends meet depend on the woman's skill in managing the family budget.

More background information is required, however, to be able to determine more accurately the aspects of the life and organization of urban housewives in order to bring out both the common features and the differences in this sector.

4. The female manual worker

Female manual workers of the secondary sector have been considered as the most modern and dynamic group, in that their work in this sector gives them greater exposure to the mass communication media, better communication and contact with workers in the same situation, and therefore a fuller view of the society in which they live and the role they play in it.

Although their level of education is higher and their occupational qualifications better, however, this does not mean that they have a greater awareness of their position in the social structure. It is well known that women are frequently used to smash movements aimed at gaining better conditions, because they are the persons who are most afraid of losing their jobs and therefore accept more unfavourable conditions. More information is needed, however, to justify pronouncements regarding variations in the labour and trade union attitudes of female manual workers.

In this group, women choose occupations which are an extension of their domestic functions: thus, most female manual workers work in the textile industry and clothing manufacture.^{21/}

It is interesting to note that, contrary to what might be expected, this sector of female industrial workers does not increase in relative terms in the same proportion as the other production sectors. On the contrary,

^{21/} It has been noted that trade union leaders elected in markedly "female" enterprises such as textile factories are always men. See J. Graciarena, op. cit., and T. de Barbieri, op. cit.

during the decade under examination there was a drop in its relative size, except in Guatemala, where there was a slight increase in the participation of this stratum.

Once again, the double task facing working women is to be noted. Although in some enterprises - the biggest and most modern - there are child care centres and nurseries, this is not so in most of them, so that workers are obliged to make various arrangements for their children to be looked after during the working day. This responsibility is often entrusted to older children or the good will of relatives or neighbours, and as always the female worker is also responsible for the organization and execution of the household work for herself and her family group. Efforts have been made to enable female workers to acquire ready-prepared meals for their families at low cost, but these attempts have been isolated and apparently not very successful.

Within the range of strata distinguished, however, this is the stratum in which women are in the best relative position, since in the case of medium-sized and large enterprises they enjoy certain basic services, while they also receive relatively higher wages compared with those of peasant women and women in the poor services strata.

5. Housemaids

Among women who work in the services sector and belong to the lower strata, two main types may be distinguished: housemaids and street vendors. Attention will be focussed here on the first type, which covers rather more than 90% of the women of the lower strata who work in the tertiary sector.

This stratum is the biggest of those so far considered. It covers the activities of almost one-third of the women who work, and although it has tended to go down during the decade it has done so only very slightly (see table 3). The average number of years of schooling differs from one country to another from one year in Guatemala to five years in Argentina in 1970. Thus, it is below the average level of the female manual worker, although higher than that of the female peasant.

/Most of

Most of the women who migrate from rural areas are absorbed into the economy through domestic work.^{22/} It is interesting to note that this sector contains the largest number of working women under 20 years of age. This is because housemaids, like street vendors, require little or no training, and this can be carried out while actually working. Moreover, the demand for housemaids is quite elastic and also very fluid, so it is possible to pass directly from domestic work in one's own house to domestic work for others, thus enabling women to reduce or increase the number of hours they work relatively easily.^{23/} On the supply side, domestic work is that in which the labour is cheapest, because of the lack of qualifications and training already referred to and the continuous flow of women from rural areas to the cities.

Two basic kinds of domestic service are to be distinguished: "living-in maids" and "living-out maids", depending on whether or not they live in the dwelling of their employers. The first type of work involves longer hours and closer integration with the people for whom the maid works. This means that a housemaid has less possibilities of organizing an independent life or forming her own family group.^{24/} The "living-in" form of work predominates in domestic service.

The constant interaction with the persons for whom a housemaid works leads her to identify herself with the values held by these persons and to displace her own class interests, and this, in view of the difficulty

^{22/} In Lima, 88% of the housemaids are migrants. See Alberto Rutté García, Simplemente explotadas. El mundo de las empleadas domésticas de Lima, DESCO, Centro de Estudios y Promoción del Desarrollo, Lima, 1973.

^{23/} See E. Jelin, "Migración a las ciudades y participación en la fuerza de trabajo de las mujeres latinoamericanas: El caso del servicio doméstico", Estudios Sociales N° 4, CEDES, Buenos Aires, December 1976.

^{24/} A study on housemaids carried out in Chile indicates that 80% are unmarried. See P. Alonso, M. Larraín and R. Saldías, Realidad de las empleadas domésticas en Chile, Departamento de Práctica y Asistencia Legal, Escuela de Derecho, Universidad Católica de Chile, Santiago, 1975.

of linking up with other workers in the same situation, makes it difficult for housemaids to perceive where their own interests lie.^{25/}

In the case of "living-out" maids, the situation may be different, since they live in contact with persons of their same social stratum who thus naturally modify their view of society.

Reference has already been made to the low social and economic significance attached to household work, not only when women carry it out for their own family units, but also when they carry it out for other persons. It is the lowest kind of work as regards occupational prestige, satisfaction and remuneration. Certain information indicates that in Greater Santiago the wages of housemaids corresponded in relative terms to only 41% of the average national income in 1970, compared with 47% in the case of manual workers and 139% in the case of non-manual workers. The wages of housemaids are far below the national daily average, and around 1972 they were only 50% of the minimum legal wage for manual and non-manual workers.^{26/}

6. Native street vendors

The difficulty in obtaining adequate information on all the Latin American women who spend part of their time in selling their agricultural and handicraft products means that it is only possible to note some important features taken from studies of an anthropological nature.^{27/} Most of these

^{25/} In the work by E. Jelin referred to in the present study, the author raises the following queries, "Up to what point do domestic servants idealize or identify themselves with their employers instead of feeling exploited and downtrodden? Up to what point does this identification prevent the development of a working class identity, thus cutting off housemaids from interaction with other workers? Are not housemaids likely to develop aspirations much higher than other members of the working class?"

^{26/} See P. Alonso, M. Larraín and R. Saldías, op. cit., pp. 54-55.

^{27/} See the part which refers especially to the commercial activities of women in Hans Buechler and Judith-María Buechler, The Bolivian Aymara, Holt, Rinehart and Winston, Inc., N.Y., 1970. See also the article by S. Minzt, "The employment of capital by market women in Haiti", in R. Firth and B.S. Yamey, Capital Saving and Credit in Peasant Societies, George Allen and Unwin Ltd., London, 1964, and Lourdes Arizpe, Indígenas en la ciudad de México. El caso de las 'Marías', Editorial Sep/setentas, Mexico City, 1975.

tend to highlight only the specific aspects encountered in each community, thus losing sight of the more general aspects common to all of them.

An essential feature is that most of the Latin American women who may be included in this category belong to the indigenous population.

Their activity consists mainly in travelling once or twice a week from the community to which they belong and where they and their families work in agricultural activities to the trading centres where their agricultural and handicraft products can be sold.

Sometimes they only act as intermediaries, since they buy the products and then sell them in the markets nearest to their place of origin.

The training needed to carry out these activities is gained by watching the mother and other adults. One of the most important aspects, which affects the prestige of the vendor and the effectiveness of her work, is the need to have a good knowledge of Spanish and to be reasonably good at figures. It has also been noted that many vendors give up wearing their native dress and adopt city styles as a sign of higher status.

Since this type of commercial activity of native women is independent, it gives them certain freedom in making decisions. They can decide with whom they are going to do business and also how they are going to fix their prices.^{28/} At the same time, the arrival at the market of other vendors gives them an opportunity to exchange experiences and communicate with people of other areas or communities, although it has been noted that there is competition among them to gain a certain steady clientele and to occupy the best places for the sale of their products.

In the study already referred to on Bolivia, mention is made of the coexistence of two forms of gaining pitches in the market, depending on whether the vendors are established traders who have purchased a pitch or have managed to establish a right to it through their membership in vendors' associations, or newer vendors who have only recently begun their trading activity and do not have any fixed pitch on which to work.

^{28/} It has been indicated, however, in the case of the native migrants to Mexico City, that the commercial activity carried out is under the control of the husband, companion or other male family member. See Lourdes Arizpe, op. cit.

The organization of these women's domestic activities during their absence one or two days a week may be the responsibility of older daughters. If their children are too small, the women take them with them when carrying out their trading activities.

Unfortunately, more detailed information is not available regarding the forms assumed by this type of insertion of rural women in the labour field. A fuller study of their situation is needed, which could serve to determine the effects that this type of activity may have when those carrying it out decide to migrate to the city.

Conclusion

The description of the foregoing types of women was aimed at partially covering some important aspects of poor Latin American women, and in particular, the variations between their different living situations. Certain types of such women were not mentioned because they represent only small groups. Among these are the groups made up of women who live in the country and belong to the lower occupational strata in secondary activities and the groups made up of women who work in the countryside but live in the city.

In spite of the effort made to summarize some of the internal differences existing between women defined as belonging to the lower strata and to bring out the generic features of each type, two serious methodological problems remain: the difficulty of studying women away from their family unit, and the shortage of relevant information which would permit a deeper analysis of each type.

At all events, some generic features common to all the types continue to be relevant, among them the lack of power and social organization of women, the open discrimination to which they are subjected, and the difficulties in incorporating them into types of work of higher productivity: a phenomenon linked with their poor qualifications and the low incomes that they can attain.

/It is

It is very necessary, then, to define the field better and to design more suitable techniques for studying it more scientifically. As long as poor women continue to be an abstract, indefinable, unmeasurable entity, the possibilities of concrete action by them to improve their situation will be ever more distant, thus further increasing the distance separating them both from other women and from men belonging to other social classes.

Introduction

The aim of this study is to appraise the present conditions of education for women in Latin America and the Caribbean. This requires a description of the existing situation and then its comparison with the desired objectives to determine whether what exists is adequate, and if not, in what sense it requires modification, with a proposal of the relevant measures for making the change. The objectives were defined in the Regional Plan of Action, henceforth referred to as the Plan, and have a double task: they constitute the pattern used to appraise what exists and a guide for selecting the variables which will be empirically studied.

The Plan states that "education is an essential factor in the economic and social development of peoples and a basic right of men and women as social beings; to receive it is therefore a principle of equity and justice...". It may be deduced from this paragraph that education is important because it fulfils two functions. It is an instrument for the training of qualified human resources, i.e. capable of undertaking efficiently the tasks of production and taking part in decision-making. It is also an essential factor for the development of human beings. The first of these links education with the activities of production and economic growth, with reference to such matters as the relation between the educational levels of the labour force and the needs of the apparatus of production. The second of the two confers on education a value per se in that it serves to develop the potentialities of human beings, permitting the full realization of the individual as a person. This is reinforced and complemented when it is established that society is just in so far as it enables all its members to put into effect their right to obtain education.

The relation existing between the two functions of education can be clarified by reference to the International Development Strategy, which states that although it is indispensable for the countries to possess a system of production capable of generating the goods required to meet the needs of the population, this is only a means to bring about "sustained improvement in the well-being of the individual and bestow benefits on all".

/Once the

Once the role played by education in development is thus defined, it must be specified how the Plan expresses the problem of women in the region in relation to education and the measures it proposes for dealing with it. The Plan begins by mentioning the inequality which affects women adversely in terms of their access to education and the nature and content of the education received.^{1/} It presents a group of action proposals for dealing with this situation, of which the following may be noted: (a) to eliminate illiteracy; (b) to increase women's incorporation into secondary and higher education; (c) to bring the supply of those leaving the educational system into line with the needs of the production system; (d) to modify both the content of the programmes and school texts so as to provide a response to production activities and the daily requirements of women from rural areas and marginated urban areas; (e) to establish coeducation and modify the image of women in a positive sense.

Having thus considered the definition of the role devolving on education and the Plan's action proposals for improving the situation of women, some characteristic trends of the education system in the region ^{2/} during the period 1960-1970 should be reviewed:

(a) Its high growth rate, in terms of the decline in illiteracy among the population of 15 years of age and over (from 42% in 1950 to 34% in 1960 and 24% in 1970) and coverage of the school-age population.

(b) Its notable absorption measured by the progress achieved in the incorporation of the population into the education system. A polemic subject is whether the opening-up of education has or has not a real impact as a channel for social promotion. It suffices to say that whatever its

^{1/} In paragraph 25 the Regional Plan of Action notes that in the region women represent a high percentage of the illiterate population and a low percentage of the population with secondary and higher education.

^{2/} See Desarrollo humano, cambio social y crecimiento en América Latina, Cuadernos de la CEPAL, No. 3, Santiago, 1975. Desarrollo y cambio social en América Latina, Cuadernos de la CEPAL, No. 16, Santiago, 1977. Germán W. Rama, Notas sobre la educación para la evaluación internacional del desarrollo, CEPAL, Social Development Division, 1975 (typescript). Carlos Filgueira, Expansión educacional y estratificación social en América Latina, DEALC/4, Buenos Aires, 1977. Germán W. Rama, Educación, imágenes y estilos de desarrollo, Cuadernos de la CEPAL, No. 31, 1979.

specific effect, access to secondary and higher education is generally regarded as a means of advance, hence social pressure to increase enrollment in these levels.

(c) Despite its tendencies to grow, the education process maintains elitist and exclusive traits. While enrollment in secondary and higher education increases rapidly, a considerable proportion of the population of 10 years of age and over continues to be illiterate.

In this general context, the situation of women in the different countries of the region will be analysed with a view to discovering which action proposals have made most progress and which should be reinforced, and in which countries of the region the situation of women is most discriminated against and is most unfavourable.

Before presenting the empirical data a proviso must be made. It should be noted that in order to propose policies it is essential to explain the situation in education, since this will allow it to be established what key factors have to be manipulated if it is to be altered in any specific sense. This requires not a sectoral analysis but an analysis of the global situation. Although there is awareness of the need to proceed in this form, this analysis will be approached sectorally and is therefore restricted to describing existing conditions so as to evaluate how much progress has been made in achieving the objectives proposed by the Plan. Since it is more specific, the study sets itself to compare the situation of men and women among countries and within each country, with a view to discovering which countries have the worst educational conditions, in which aspects of the educational system the greatest inadequacies are to be found and in which the differences between the educational situation of men and women are most pronounced.

A. FEATURES OF THE EDUCATIONAL SITUATION OF WOMEN, 1960-1970

It is apparently easy to measure the situation of education since abundant statistical data are available. Some aspects remain unclear, however, such as the drop-out rates and female absenteeism, differences in the content of curricula and in the form of teaching boys and girls. The

/information available

information available for the study of these latter aspects is scattered and generally of a qualitative nature and frequently based more on speculation than on research.

Statistical data exist for studying illiteracy and levels of educational attainment. The usefulness of census data for tackling the study of the situation of women in respect of these variables has been demonstrated in numerous studies and pieces of research. But these studies have equally shown their limitations. It is not, therefore, superfluous to repeat that the data provided by the census only allows a global analysis of the situation of women considered as a nominal category.^{3/} This means that different situations can be distinguished between countries and within a single country among men and women, but the differences existing within the category of women are ignored.^{4/}

Having made these clarifications we shall go on to the empirical evidence required to analyse the situation of women in the region in terms of their degree of literacy and their educational attainment.

^{3/} For a discussion of this topic, see Carlos Borsotti, "Situación de la Mujer y Desarrollo: Acotaciones" in Paz Covarrubias and Rolando France, Chile: Mujer y Sociedad, Santiago, Alfabetá, 1978, pp. 770-773.

^{4/} Hence it may be concluded that it might be more appropriate to use other forms of research so as to deal with the matter in more detail, by studying different types of women. This could be a recommendation for the next appraisal, since in this case the pattern started off from an earlier definition of the empirical material available, and not the reverse as might have been desirable, i.e., from a selection and ultimately from the collection of the data in terms of the substantive problems of the appraisal defined a priori.

1. Literacy

Table 1 gives data on the percentages of illiterate persons in the male and female population according to area of residence for two periods: around 1960 and around 1970.^{5/}

When only the global percentages of illiteracy are considered, it may be seen that in all the countries the illiteracy of the population in general and of the female population in particular has continued to decline. The differences between countries, however, continue to be very considerable. If the percentages of illiterate women existing in 1970 are examined it will be seen that of the 18 countries for which data are available, 5 have 5 to 12% of female illiteracy, while at the other end of the scale there are 5 countries in which more than 40% of the women are illiterate.

Lastly, in all the countries the percentage of illiterate women is higher in rural areas.

Table 2 makes it possible to take the analysis further since it: (a) classifies the countries of the region into three types according to the size of their percentage of illiterates in 1960; (b) places the countries in order according to their position on a scale ranging from the smallest to the highest percentages of illiteracy (position 1 corresponds to the country with the lowest percentage of illiterates and the top position to that with the highest percentage of illiterates); (c) orders them according to the position they occupy in terms of the size of the differences between percentages of illiterates in the male and female population.

^{5/} Since these are data taken from the national censuses, the exact dates of each vary. We therefore refer to these two points in time on the understanding that they constitute approximations. It should also be added that this is a census measurement which probably underestimates the level of illiteracy which could be derived from a more adequate measurement of functional illiteracy.

The data were obtained from standardized census samples (OMUECE programme), the advantage of which is that they allow comparisons between countries. Their limitation, however, is that they refer only to some countries. The analysis therefore centres on these countries. Information for the rest was completed by using data from censuses or surveys, or both so that it is not possible to make comparisons. This data series is therefore presented as an approximate indication of the type of situation existing in these countries.

Source: Prepared on the basis of Table 1.

a/ Grade 1 on the scale means that the country so designated has the smallest percentage of illiterates, while grade n corresponds to that with the highest percentage.

b/ Grade 1 on the scale means that the country so designated has the smallest difference between the percentages of the female and male illiterate population.

c/ Type 1 comprises countries which in 1960 had less than 20% of illiterates.

d/ Type 2 covers countries which in 1960 had between 21% and 39% of illiterates.

e/ Type 3 groups countries which in 1960 had an illiterate population of 40% and over.

/The data

The data presented allow several conclusions to be drawn:

- The three categories established according to the percentage of illiterates existing in 1960 prove to be a significant form of grouping countries. These categories are shown to persist and are associated with the situation of women. Thus the countries with the lowest illiteracy in 1960 conserve this position in 1970.

- In each category the position of the countries in 1960, on a scale from lowest to highest illiteracy for the whole population, coincides with the position of the countries in respect of the lowest or highest illiteracy among the female population. This coincidence is maintained in 1970, except for slight differences. To quote two extremes, this is the case of the countries with the lowest percentage of illiterates - Argentina, Barbados, Chile, Jamaica, Trinidad and Tobago and Uruguay - and that of the countries with the highest percentages - Bolivia, Haiti, Honduras, Guatemala, Nicaragua and El Salvador.

- The difference, measured in points, between the percentage of illiterates in the female population and the percentage of illiterates in the male population is an indicator of equality between the sexes. Whatever the level of illiteracy, this measurement only shows the difference between the situation of women and men. It may be seen from these figures that the differences tend to decrease except in 4 countries - Peru, El Salvador, Guatemala, Trinidad and Tobago - where they increase to the disadvantage of the female population.

The size of the differences existing between the percentages of illiterate men and women is generally small: less than 2% in 8 out of 18 countries for which data are available. There are, however, three countries - Guatemala, El Salvador and Peru - where this difference is 15 or more points to the disadvantage of women.

The evidence presented allows it to be concluded that the higher the percentage of illiterates in a country, the greater the differences to the disadvantage of women. This adverse situation of women is worse in rural areas. Illiteracy is not only higher there but the size of the differences which tell against women is also higher.

/If illiteracy

If illiteracy is analysed dynamically, i.e., by examining the percentages of growth of literacy (see tables 3 and 4), the patterns for the different countries are dissimilar. It may be observed, for example, that in Guatemala and Peru the differences between the sexes are increasing: while literacy increases at a rate of 10.7% for men, it only increases at a rate of 6.7% for women. At the other extreme, however, Brazil, Costa Rica, Chile, the Dominican Republic and Uruguay show higher increases in literacy among women than among men.

In conclusion it may be said that action has been undertaken which, if continued, will make it possible to eliminate illiteracy in type 1 countries and reduce it in the rest. A parallel process of equalization of the sexes is in progress in the majority of countries.

Lastly, it was considered appropriate to make a cross-classification of the situation of the countries in respect of their degree of illiteracy and the size of the differences between the percentage of illiterates in the male and female population (see table 5).

The importance of this table for policy formulation should be mentioned, since it makes it possible to deduce the importance of undertaking literacy programmes in general or literacy programmes aimed particularly at taking in the female population or both types. Two examples may be quoted to illustrate this. In Argentina, Chile, Costa Rica and Uruguay, it may be assumed that the problem is being adequately tackled and that, if everything continues as now, it will move towards a solution. In Guatemala, El Salvador and Peru, however, attention must be given to the problem of illiteracy and to proposing programmes directed especially at the female population.

2. Educational attainment

We shall now look at the access women have to the different levels of education. It should be recalled that the objectives pursued here are:

(a) to ensure that the female population will at least have primary education, thus eliminating what might be termed "critical ignorance";^{6/} (b) to increase the incorporation of women into other levels of education.

^{6/} This term is proposed in the final report of the Project on development and education in Latin America and the Caribbean, sponsored by UNESCO, CEPAL, UNDP, DEALC/8, Buenos Aires, 1978, p. 35.

	Less than two points	Between 3 and 7 points	15 points and over
Less than 21	Argentina, Costa Rica, Uruguay, Chile, Panama, Colombia	Paraguay, Trinidad and Tobago	
21 and over	Dominican Republic, Nicaragua	Brazil, Venezuela, Haiti, Mexico, Paraguay, Honduras	Guatemala, El Salvador, Peru

Sources: Operación de Muestras de Censos (OMUECE); UNESCO, Statistical Yearbook, 1976, and data processed by CEPAL.

The analysis will be based on two types of data: one reflecting the educational attainment of the population as a whole and the other relating the population at a specific level of education with the population of an age for this level. The latter serves to eliminate the adverse effect of the educational lacunae of the oldest groups.

(a) Primary level

The figures in table 6 indicate that in all the countries the percentage of women who completed their primary education increased between 1960 and 1970. As in the case of illiteracy, however, there are major differences among the countries under consideration, which fall into the same groupings as in table 2. In other words, the four countries which form the group with the lowest percentages of illiterates in 1960 are again the countries in which the highest percentages of the female population complete their primary education; and vice versa, the countries which form the category with the highest percentage of illiteracy are again the countries where the smallest percentage of women finish their primary education. The four countries in which the educational situation of women is relatively better have achieved percentages of the female population with complete primary education ranging between 40 and 53%. In the case of the countries with the lowest percentages for women's primary education, these figures are below 20% of the female population.

In order to analyse more specifically what was taking place between 1960 and 1970, setting aside the effect of the educational shortcomings of the advanced age groups, it is necessary to study the population enrolled in each educational level in relation to the population of the corresponding age, the figures for which appear in table 7.

These data show that progress is being made towards the objective of ensuring that women have at least completed their primary education. This is borne out by the fact that the rates of female enrollment have increased in 22 of the 24 countries under consideration. Furthermore, if the 1970 enrollment rates are compared with the 95% enrollment which is the average

a/ Total enrolment as a percentage of the total population of the corresponding age group. Definitions vary according to the ages and years of primary schooling established by the legislation of each country.

/continental European

continental European rate,^{7/} the rates turn out to be satisfactory in 17 of the 24 countries studied.

In order to compare the access of men and women to primary education within each country, the arbitrary benchmark was adopted of 4 percentage points of difference between the enrollment rate of the female population and that of the total population. In 1960 there were 7 countries in which this difference was 4 points or more, in 1970 only 3; and the size of the differences had also decreased. This shows that women still have a somewhat smaller possibility than men of enrolling in primary education.

The question now arises of how women use the educational opportunities afforded them. The answer is derived from a study of school drop-out and repetition and the percentages of continued attendance in the educational system; unfortunately the analysis of school drop-out had to be given up because the necessary data were not available.

The information on repetition percentages appears in table 8. It may be seen that in the first school year women tend to repeat less than men, but in the sixth year the performance of the two sexes tends to become similar. The percentages of first-year repetition are strikingly large.

In order to calculate continued attendance in school, a cohort is followed from enrollment in the first level through to the final year, and the figures are expressed as percentages of the students who finish in relation to every 100 initially enrolled. Information was available for only two countries and, what is worse, shows contrary trends for the two sexes. Thus in Ecuador the percentage for women is lower than for men; while in Colombia the opposite is true (see table 9). What is clear is that continued school attendance is greater in urban zones than in rural areas, and that in the former the differences between the sexes are smaller.

It may be observed in passing that one of the most serious problems encountered is the poor performance of the educational system. This underscores what was said in relation to the high figures for first year repetition. In the only country for which information is available, 25% of

the school children are lost between the first and the second year, and as much as 50% in rural areas. It is therefore worth recalling that the demands of the school system are not adapted to the development of the child, particularly as regards ability of verbal expression. This is all the more serious in rural zones where isolation is greater. The lack of fit between the abilities developed in children and those needed to follow educational programmes must be one of the factors explaining the system's low effectiveness. This is substantiated by the arguments used by parents when their children have to repeat a school year or drop out of school, to the effect that the child "hasn't got a head for studying".

If it is also borne in mind that, particularly in rural zones, sending children to school represents a sacrifice (large distances to be covered, doing without the child's contribution in work, suitable clothing, etc.) and that according to some researchers, parents do not see any clear effects for their future occupations - if they are men, to work the land, and in the case of women, to be housewives - it is easy to understand why they are allowed to drop out of school.

It is worth remembering that currently the completion of primary education in itself has increasingly less significance, being a pre-requisite for entering the educational system but not providing sufficient knowledge to ensure that the pupil can perform successfully in his working life. This is due to the fact that the rapid growth of education has changed the value of schooling as a means of gaining access to jobs. Because there is an increasingly well-educated labour force, the need to chalk up an ever greater number of years of schooling has nothing to do with the volume of knowledge needed to perform a specific job.^{8/} This suggests the futility of primary education at least as a means of achieving equality of opportunity, since as an increasing number of the population attain that level, its value as a means of getting jobs declines. Consequently, primary education is of little importance from the standpoint of the training of

^{8/} This has come to be called 'educational stagflation'. See Henry Kirsch, El Empleo en América Latina: mirada retrospectiva y perspectivas para el futuro, E/CEPAL/DS/183.

skilled human resources, but remains important as a means of developing the intellectual potential of human beings, which is really the point which should be stressed.

(b) Secondary level

Broadly speaking, women's access to secondary education may be said to have improved, as is shown by the data in tables 6 and 7. In 1960 the percentage of women of the right age to be enrolled in secondary education and actually enrolled varied between 6 and 34%, whereas in 1970 the percentages ranged from a low of 9% to a high of 50%. Looking in detail at the 19 countries for which information is available, in 1970 there were 5 in which 40% or more of the women of the right age to be enrolled in secondary education were in fact enrolled. At the other end of the scale, in five countries this percentage was 20% or less, while in the remaining 9 countries the figures ranged from 21 to 39%.

With regard to the different access of men and women, in 1960 women lagged behind in almost all countries. In 1970, on the other hand, women led in as many countries as they lagged behind in. The countries with a low percentage of secondary students are the only ones in which the difference was unfavourable to women. Looking at the enrollment of the total population of secondary school age, there is a clear trend towards less discrimination against women. In 1960 there were 10 countries, out of a total of 18, in which the percentage of women in secondary education was smaller than the percentage of the total population; five countries where women's access was the same as that of the total population; and three in which it was higher. In 1970, the female population lagged behind men in 7 countries, was equal in 3 and had greater access in 8 countries.

(c) Higher level

The data show that in 1960 between 0.1 and 2.7% of the female population of the corresponding age were enrolled at the university level. In 1970 the situation was better, with percentages of 0.4 and 3.7.

It is at this educational level that the differences against women are greatest. Table 10 indicates that in about 1960 women represented over 40% of the enrollment in higher education in only 2 of the 20 countries, whereas in 8 countries they accounted for less than 20%. This situation

Notes: This is an extension of the table prepared by Marshall Wolfe in "La participación de la mujer en el desarrollo de América Latina", CEPAL, Mujeres en América Latina, Fondo de Cultura Económica, México City, 1975, pp. 16-17. The following classification is given there:

- Letters: Archeology, History, Languages, Literature, Library Science, Philosophy, Psychology, Theology, etc.
- Education: Theory and practice of pedagogy (including topics studied in higher teacher-training establishments), Physical Education.
- Fine Arts: Architecture, Drawing, Music, Painting, Dramatic Arts and Speech, etc.
- Social Sciences: Banking, Commerce, Diplomacy, Economics, Ethnology, Geography, Home Economics, International Relations, Journalism, Political Science, Public Administration, Social Sciences, Sociology, Statistics, etc.
- Exact and Natural Sciences: Astronomy, Bacteriology, Biochemistry, Biology, Botany, Chemistry, Entomology, Geology, Geophysics, Mathematics, Mineralogy, Physics, Zoology, etc.
- Engineering: Applied Sciences, Construction, Geodesics, Metallurgy, Mining, Projecting, Technology, Textiles, etc.
- Medical Sciences: Anatomy, Odontology, Obstetrics, Nursing, Optometry, Osteopathy, Pharmacy, Physiotherapy, Public Health, etc.
- Agriculture: Agronomy, Dairy Industry, Fishery, Silviculture, Horticulture, Rural Sciences, Veterinary medicine, etc.

- a/ Education included in Letters.
- b/ Social Sciences and Law together.
- c/ Excluding private university education which started in 1966.
- d/ San Carlos University only.
- e/ Architecture included in Engineering.
- f/ Pharmacy included in Natural Sciences.
- g/ Education not included in the higher level education.

/had improved

had improved ostensibly by the 1970s: in 8 countries female enrollment was 40% or more, and less than 20% in only 4 countries.

It is interesting to look at the enrollment of women in the different disciplines. There is a disproportionate enrollment in fine arts and education, where women represent the majority in almost all the countries. Their enrollment in social sciences, exact and natural sciences and law is much smaller; and in engineering and agriculture it is quite low.

The above may be interpreted along the lines that women choose the subjects which are an extension of the roles they fulfil at home. The question then arises of to what point the survival of the orientations which lead women to fulfil their traditional role is preventing countries from using their potential skills and training them to be highly skilled human resources, to the advantage of their economic growth.

In order to complete this sketch of the educational picture, some data should be given on the growth and distribution of enrollment by educational level, and on the numbers of women enrolled at each level. Since these are global figures for Latin America, they can only serve to indicate general processes (see tables 11, 12 and 13).

It may be seen that school enrollment has increased appreciably at all levels, although much more rapidly at the secondary and higher than at the primary level. This indicates the direction in which governments have channelled their efforts to improve the educational sector in response to heavy social pressure, particularly from the middle and upper sectors. This orientation underlines what was stated in the introduction: so long as the objective of eliminating illiteracy and providing primary education for all member of the society is not achieved, the high growth of the secondary and upper levels represents a deviation from the standpoint of the equitable pattern of providing education for all.^{9/}

As regards the access of women to the different educational levels, women are clearly at a disadvantage only at the higher level. But since the enrollment of women in universities is growing rapidly, more than

^{9/} In the Statistical Yearbook, UNESCO provides information on the educational budget and amount devoted to each level which shows a considerable distortion in the allocation of resources along the lines indicated.

/proportionally in

proportionally in relation to male enrollment, this disadvantage should be decreasing. It should be asked, however, whether the aim at this level is to arrive at equal percentages of men and women with higher education or to achieve an equitable distribution of this scarce and expensive resource in keeping with an educational policy linked to national development.

3. Co-education

Another of the objectives clearly set forth in the Plan is the need to establish co-education, which is considered a means of modifying relationships between men and women, and thus as an instrument for changing the stereotypes concerning what men and women are and what they should do.

The material available for assessing the degree to which this objective has been attained is the information provided by governments in replying to the questionnaire on the implementation of the Plan.

In this connexion, it should be pointed out that not all the countries which sent back the questionnaire dealt with co-education. Bearing in mind the rather scanty basic information on which these statements are based, it may be said that at the legislative level some countries established co-education at the primary level in the mid-1940s and others - the great majority - more recently. Co-education at the secondary level exists in some countries and only in some of their educational establishments. At the higher level education has traditionally been mixed, and the only innovation is that admission is not conditioned on grounds of sex.

There are still some segregated primary schools, mainly of a private nature and particularly for girls.

4. Content of education

It should be noted that only the content of the education given by the educational system will be discussed here. In other words, nothing will be said about incidental education or the socialization process

/which takes

which takes place through the daily interaction of countless agents outside the educational establishment.^{10/}

With these reservations, it is necessary to define what is meant by the term "content of education". Here the expression covers the following: the content of the curriculum, the textbooks used, the concepts, images and ideas contained in the teaching material and the treatment on the part of the teacher which tends to reinforce or suppress psychological traits, attitudes and preferences on the part of the pupils. Despite the importance of each of these topics, very little background research exists.

The curricular content and textbooks used in primary education are the same for men and women. The texts, primarily readers, show women in the role of housewife and mother, as a passive person without any capacity to make decisions.^{11/} If she is gainfully employed, she appears in job consistent with the female stereotype: secretarial work, domestic service, fashion, nursing, teaching, hairdressing.^{12/} If the textbooks present women in this light, it may be assumed that implicitly they are teaching that these are the characteristics women can and should have, as well as the jobs they can and should do.

Treatment by teachers, in the case of women, means that they are encouraged to adopt a passive attitude, while men are allowed greater independence. These two features tend to reinforce and reproduce the

^{10/} It should be stressed that incidental education or socialization has not been dealt with purely for pragmatic reasons - lack of suitable data and time to deal with so complex a topic. In view of its crucial importance as a process which shapes attitudes and behaviour, it is recommended that the necessary studies should be undertaken immediately so that the topic can be included in the next appraisal. Similar considerations hold for informal education programmes. The usefulness of such programmes lies in the fact that they can achieve great results in a relatively short period of time.

^{11/} Elba Barreto and Guiomar Lello, "A mulher e o Sistema de Educação Formal", paper presented at the Primer Simposio Mexicano-Centroamericano de Investigación sobre la Mujer, Mexico City, 7-9 November 1977.

^{12/} Mirta González, "La educación formal como modeladora de actitudes en la relación a la división del trabajo por sexo", paper presented at the Primer Simposio Mexicano-Centroamericano de Investigación sobre la Mujer, Mexico City, 7-9 November 1977.

sexual stereotypes and thus the educational system helps to maintain the present division of sexual role.

As regards career choice, in secondary education women are primarily guided towards technical education. Technical secondary schooling is selective, and there are different possibilities for men - particularly in the industrial and agricultural branches - and women - fashion, hairdressing, secretarial skills.

As regards higher education, it has already been stated that women enroll much more in some disciplines than in others (see table 10), which is logical enough bearing in mind the content of the education they have received from their primary school days, a content which is entirely in keeping in its intentions with the careers they subsequently choose.

B. THE SITUATION SINCE 1975

It is worth making a cursory description of events on the region in the 1970s.^{13/} After the high economic growth rates achieved in the early years of the decade, since 1974 there has been a period of deteriorating terms of trade, more severe problems in servicing the external debt, etc., all of which has cut back the resources available to governments and led them to adopt austerity policies. In particular, there has been an interruption of the rapid growth of the enrollment in higher education and social programmes - in this case, education - have been subordinated to criteria of efficiency and self-financing. This is the context in which events as regards the educational situation of women must be viewed.

The data for studying this situation are those provided by the governments in replying to the questionnaire on the progress achieved in the implementation of the measures set forth in the Plan. As was pointed out above, the type and quality of information provided by the countries which answered the questionnaire vary considerably, and therefore the empirical bases for describing what has happened is unsatisfactory, which hinders an appraisal of the progress achieved.

^{13/} See CEPAL, Desarrollo y Cambio Social en América Latina, Cuadernos de la CEPAL, No. 16, Santiago, 1977, pp. 51-53.

The elimination of illiteracy is a prime concern of the governments of the region. To this end they have undertaken special adult education programmes, accelerated literacy programmes and so on. Nevertheless, the results achieved are relatively modest and, as was seen above, much remains to be done in a number of countries.

It should be stressed that none of the countries has official programmes specially for women. While some countries have special programmes which provide facilities for workers, housewives and adults in general to complete their primary education, except for the cases of programmes aimed at housewives there are no special programmes for women.

Primary education is free and in some countries legally compulsory. In practice, however, this legislation is not suitably applied in some countries.

Little can be said about secondary and university education, which may be seen as an indication of the fact that specific measures have not been taken on behalf of women.

As far as co-education is concerned, it would appear that the countries which did not previously possess it introduced it from this period onwards. However, it prevails at the primary level and applies principally in the schools belonging to the public sector. Some of the private schools tend to continue to be segregated by sex. At the secondary level co-educational instruction is provided only in some of the establishments, generally those established recently.

Schoolbook content is being revised, and some governments plan to eliminate references which imply discrimination between the sexes.

In short, one may observe in the region a wish to improve and extend the coverage of the educational system, and this has meant substantial progress. However, the changes are being introduced slowly and, in general, the qualitative aspects of the content of the instruction provided are passed over. Accordingly, it is of interest to emphasize that, by transmitting content which corresponds with sex stereotypes, education is one of the means by which the existing situation is maintained; in addition, it should be borne in mind that if this content is altered, education might be a powerful instrument for changing the status of women.

C. PRINCIPAL PROBLEMS

It is of interest to emphasize which are - and which are likely to be in the 1980s - the principal educational problems affecting women. The first noteworthy point is that, whatever aspects are analysed, the greatest distinctions to the detriment of women occur in the countries with the lowest educational levels.

The aspects of the educational system are briefly reviewed below, highlighting the specific problems of each of them, particularly as regards the status of women.

It would seem that illiteracy is ceasing to be an important problem in the countries of type 1 (see table 2). In the type 2 and type 3 countries it will continue affecting a substantial proportion of the population, particularly women in rural areas.

Although the coverage of primary education has been extended and the enrollment rates achieved give grounds for optimism, several decades are still needed to achieve the objective that the entire population should complete at least basic education. At this level there are no marked differences based on the sex of the child, but differences do occur based on areas of residence, and special attention is needed for rural areas, which are the areas which lag behind. Primary education provided by government establishments is free. However, it is not sufficient to ensure total coverage, which, as will be remembered, depends on two types of factor. On the one hand, parents in low socio-economic strata cannot afford to send their children to school, and do not see in education a real opportunity for economic benefit and social mobility. On the other hand stand the shortcomings of the educational system, whose principal symptoms are the high number of children who have to retake a year and the high drop-out rate.

The implicit content of education is of greatest importance at the primary level, because what is learned at that age determines which features will stand out and which will be discouraged in the child's personality. In addition, the aspirations and attitudes generated here

/tend to

tend to persist to a large extent. Hence the importance both of the content of the reading books and of the approach of the teacher. Unfortunately, both are discriminatory vis-à-vis the image of women, and also vis-à-vis the choices to which they guide them. The result is to strengthen the negative stereotype of women. This problem, which would be relatively easy to solve, has not been faced up to directly, because it involves a redefinition of key features of society, such as the form of the division of labour as far as the sexes are concerned, the consequent relations of economic interdependence between men and women in the home and in society and, more generally, the prevailing structure of domination. Redefining these features is a task which provokes substantial resistance and fear.

The secondary level presents no major problems, since it is expanding its coverage of women at a satisfactory rate, and in general women are not discriminated against in it. What does give rise to some doubts is the fact that specialization by women is restricted to learning certain middle-level occupations and technical careers.

Discrimination against women is greatest in higher education. Nevertheless, and in view of the rate of increase in female enrollment, which is higher than that of men, this discrimination is tending to lessen. However, there is still a specialization by course which follows the general lines laid down by sex stereotypes, but which is also tending to decline.

It should be mentioned that, although it is possible to observe a tendency for women to be guaranteed increasingly fuller access to the secondary and higher levels of education, a movement towards egalitarian access (in the literal sense of distribution by halves) is not the same as a movement towards equitable access. It should be remembered that education has a dual function - to train persons with their intellectual capacities developed to the maximum, and to train human resources qualified to produce and manage society properly.

It is usually said that women underuse the knowledge they acquire in the educational system, in the sense that many women make no use of it in the labour market. This judgement ignores the fact that education also

/fulfils the

fulfils the function of developing the intellectual capacities, which women use in daily life to understand the circumstances in which they live, to draw maximum benefit from the resources available to the family - nutritive foods, environmental conditions which promote health and psychological balance among its members - to make use of the welfare services provided by society and to socialize their children so as to develop their potentialities to the maximum.

This leads one to ask whether the education provided is appropriate to the need to train persons who are intellectually developed and human resources qualified for the living conditions they will have to face. Thus the quality and content of instruction come to be a problem which goes beyond the sphere of education, since it is vital from the economic and social viewpoint, in terms of the productive needs and social roles which it must fulfil.

Thus arises the question of what education must transmit, or more precisely what knowledge should be imparted to convert individuals into persons who are capable of understanding the circumstances in which they live. What knowledge should be imparted to all, and what should be included only in individualized programmes? It should be reiterated that the aim of education should be to ensure that everyone is an intellectually developed person, possesses basic knowledge for life and is a human resource qualified for an economically and socially productive existence. In other words, the education received should be equitable for all: on the one hand, it should form all-round human beings, and on the other, it should train all types of workers on the basis of their particular forms of work. It should be remembered that this makes it difficult to achieve a balance between equality of opportunity for all and a specialization which is efficient for society.

/D. RECOMMENDATIONS

D. RECOMMENDATIONS AND SUGGESTIONS FOR ACTION

This section sums up the foregoing as a foundation for outlining a group of problems and actions related to concrete action programmes, research which is necessary for the improvement of subsequent evaluations, the assessment of available sources of information and the additional information which is needed.

If it is remembered, firstly, that the greatest differences to the detriment of women may be observed in the countries with the least favourable educational conditions, and, secondly, that most of the countries of the region have neither increased nor properly distributed their financial resources for education, it is clearly necessary to establish policies and define some high-priority substantive aspects where action should be concentrated and resources channelled to promote the advancement of the least favoured groups.

In laying down that basic education is the right of all human beings, the Regional Plan of Action justifies the priority given to the eradication of illiteracy and primary education for all. The information provided makes it possible to establish where literacy campaigns are needed most urgently, and in which of these situations special emphasis should be given to attracting the female population, which at present is not done. In all the countries special attention should be given to the rural areas, since it is there that there is most illiteracy.

As far as primary education is concerned, it is recommended that measures should be taken to:

(a) Extend its coverage, without the need to place special emphasis on action in favour of women, except in particular cases which each government should consider. Since in most of the countries enrollment stands at adequate levels, the action should be aimed in particular at facilitating the integration of young adults so that they can complete the primary cycle through special programmes, and lowering the drop-out rate by extending the period spent in school until the completion of this basic cycle.

/(b) Guarantee

(b) Guarantee real possibilities of access to and remaining in the educational system for children from the poorest strata; this implies that the family should enjoy the economic resources necessary to manage without the labour of the child, and to clothe and feed him properly. The school should make up the shortcomings observed in these respects.

(c) Review the present teaching arrangements so as to increase the productivity of the school system. This requires: (i) an adjustment in the needs of the process of instruction, especially those of the first year of study, in line with the real learning capacities of the children. Thus, for example, it cannot be assumed that those who have not followed the pre-school level have had an opportunity to develop the verbal and conceptual skills needed to learn to read and write; (ii) making it clear, especially in rural areas, that the main benefit of primary education is the development of the child's intellectual capacities, which enables him to understand better the world in which he lives. Making it clear, at the same time, that this level has no direct economic benefit nor any major impact on future social mobility; (iii) the definition, in accordance with the highly abundant existing technical materials, of the objectives which should be pursued by this level of education and the type of instruction to be provided. It will be enough to mention here that the major requirement of basic education is that it should be significant both for the fulfilment of the individual and in meeting the demands of the social context in which he will live.

(d) Eliminate content in which discriminates against women, both in the textbooks and in the interaction between the teacher and the schoolchild. In relation to this subject there are various actions to be taken: (i) to investigate and assess the content at present being transmitted through the educational relationship; (ii) to prepare appropriate texts; (iii) to investigate and assess the behaviour and attitudes which the teachers reinforce in their male and female pupils; (iv) to plan seminars for teachers to make them aware of the content transmitted in the interaction with the pupils, analyse the results of this in terms of sex discrimination and ensure that they draw up guidelines which lay down which behaviour and activities should be reinforced and how to do so.

/(e) Continue

(e) Continue to introduce co-education, extending it to schools in the private sector and to the secondary level.

At the secondary level it is recommended that the present programmes for technical and vocational training should be revised so as to reconcile the demands of the labour market with the need to provide knowledge which is useful to the individual in his adult life and with the principle of non-discrimination between the sexes.

Both for the secondary and for the higher level it is recommended that the objectives to be pursued at each level should be specified, and that therefore what is involved in equitable access for women to them should also be specified. For this purpose it is necessary to bear in mind that education should be, firstly, a means of giving students of both sexes equal opportunities for any type of work and, secondly, should provide them with the knowledge required to work satisfactorily in their daily lives and thus contribute to greater efficiency in social life, and help to facilitate the development of their potentialities and contribute to their fulfilment as individuals. It is worth mentioning, in passing, that these objectives have not been reached in contemporary society either for men or for women and that, for that reason, they are doubly important.

Finally, a group of suggestions is set out related to the appraisal of progress achieved in the implementation in the Regional Plan of Action.

Census information and educational statistics provide a general view of women's circumstances in the region and within each country, and thus make it possible to compare their status with that of men. However, the assessing unit has no updated information for all the countries. Hence it is recommended that governments should:

(a) Dispatch the information, both the statistical data gathered periodically by the respective Ministries of Education and the additional information derived from surveys and research.

(b) Compile information or carry out research concerning certain subjects of which knowledge is scanty, namely: dropping out, forms of instruction and content of texts.

/(c) Consider

(c) Consider the desirability of using a different model to carry out the assessment. It may be desirable to opt for a model which does not consider women as a statistical and nominal category, but studies particular types of women in concrete situations - for example, working women, peasant housewives, professional women, and so on. This will require a prior definition of specific underprivileged groups. It is also suggested that substantive aspects should be defined which should be studied in relation to these groups, and in particular those which are related to their structural situation and the factors associated with the greater deprivation and shortages which affect them.

The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that proper record-keeping is essential for the success of any business and for the protection of the interests of all parties involved. The document then goes on to describe the various methods and procedures that should be followed to ensure that all transactions are properly recorded and documented.

The second part of the document provides a detailed explanation of the accounting process, from the initial recording of transactions to the final preparation of financial statements. It covers the various steps involved in the accounting cycle, including the identification of transactions, the recording of transactions in the journal, the posting of transactions to the ledger, and the preparation of trial balances and financial statements.

The third part of the document discusses the importance of internal controls and the role of the auditor in ensuring the accuracy and reliability of the financial statements. It describes the various types of internal controls that should be implemented and the various procedures that should be followed by the auditor to ensure that the financial statements are free from material misstatements.

1. The first part of the document discusses the importance of maintaining accurate records of all transactions and activities. It emphasizes the need for transparency and accountability in all financial dealings.

2. The second part of the document outlines the various methods and techniques used to collect and analyze data. It includes a detailed description of the experimental procedures and the statistical methods employed.

3. The third part of the document presents the results of the study. It includes a series of tables and graphs that illustrate the findings and the trends observed over the course of the experiment.

4. The fourth part of the document discusses the implications of the results and the potential applications of the findings. It also addresses the limitations of the study and suggests areas for future research.

5. The fifth part of the document provides a summary of the key findings and conclusions. It highlights the most significant results and the overall impact of the study.

6. The sixth part of the document includes a list of references and a bibliography. It cites the works of other researchers and scholars in the field, providing a context for the current study.

7. The seventh part of the document contains a list of appendices and supplementary materials. These include additional data, charts, and documents that provide further detail and support for the main text.

8. The eighth part of the document is a concluding statement that reiterates the main points of the study and expresses the author's gratitude to the funding agencies and the research team.

9. The ninth part of the document is a list of acknowledgments, where the author thanks the individuals and organizations that provided support and assistance throughout the project.

10. The tenth part of the document is a list of contact information for the author and the research team, including email addresses and phone numbers.

A. INTRODUCTION

1. Employment of women in relation to the objectives laid down by the Regional Plan of Action

The present study is designed to assess the present status of the employment of women in Latin America and the Caribbean. In order to do so it is necessary to describe the prevailing situation, and then, comparing it with the objectives laid down, to determine whether it is satisfactory and, if not, in what direction it must be changed, proposing appropriate measures to modify present circumstances in the direction of the objectives.

The objectives were laid down in the Regional Plan of Action, referred to below as RPA, and play a dual role: they form the framework within which the present situation can be assessed, and a guide in selecting the variables which will be empirically studied.

The RPA lays down that "there are real limitations on the incorporation and retention of women in work, and this hinders their participation in the political, economic and social life of their countries".^{1/} From this paragraph one may deduce that work is important because it is a factor which determines participation in other fields of social action. In addition, "one of the fundamental limitations on the access of women to work, education, management responsibilities and possibilities of development is the excessive work load imposed on them by the domestic tasks which are wrongly viewed as the exclusive occupation of women".^{2/} And "the division of work established on the basis of sex, supported by tradition and customs under the pretext of biological determinism, assigns to the man the role of supporting the home and relegates the woman to a secondary and passive role limited to the narrow confines of the home, with the sole basic purpose of maternity and child-bearing".^{3/}

^{1/} RPA, paragraph 22.

^{2/} Ibid., paragraph 40.

^{3/} Ibid., paragraph 37.

The foregoing should be considered in the light of the principle that "all human beings without distinction have the right to enjoy the fruits of social and economic progress and should, on their part, contribute to it, condemning sex discrimination as an offence against human dignity and an infringement of human rights".^{4/}

This is why the World Plan of Action lays down the following ambitious objective: "to define a society in which women participate in a real and full sense in economic, social and political life and to devise strategies whereby such societies could develop".^{5/}

Having defined the role of work in relation to equality of rights and duties between men and women, it is necessary to specify how RPA poses the problem of women in relation to employment and the measures it proposes for tackling this problem. The plan begins by pointing out the low percentage of women in the labour force, the specific forms of employment of those who are in the labour force, and the discrimination as far as remuneration is concerned.

In order to remedy this situation, RPA proposes a group of actions which, in the light of the minimum targets adopted in the World Plan of Action, can be grouped under three headings: (a) the adoption of legislative measures and the formulation of policies designed to ensure equality of opportunity in the employment and treatment of working women - indicating, for example, the need to increase their opportunities of employment, their right to work, the application of the principle of equal pay for equal work, access to the best-paid jobs - and citing two particularly critical cases: those of rural women and domestic servants; (b) the promotion of positive attitudes towards female employment, and research into the cultural factors which lie behind sex discrimination; (c) the proper valuation of housework by demonstrating that the work of housewives has economic value and granting them due standing. Here two aspects stand out: (i) redefinition of the roles of men and women within the family, so that both have the same rights and responsibilities in it and both can assume an active role in society; (ii) study of the conditions in which women work and assessment of their economic contribution.

^{4/} World Plan of Action, pp. 9-10.

^{5/} Ibid., p. 11.

In short, it is clear from the provisions of both RPA and the World Plan of Action, that a study of the situation of women's employment will have to examine their levels of participation in the labour market and the jobs they hold, taking into account the influence of the role played by women within the family and its relationship with housework.

What has been said so far suffices to show which aspects must be described, but not to understand the social processes which lie behind the fact that women have a low level of participation in the labour force. Still less does it suffice to understand the nexus between this and their belittled role in the family and society. It should be pointed out that if these factors are not understood, it will be difficult to recommend policies which are capable of altering the situation.

Hence the need for a conceptual approach to the problem, even if it is briefly outlined. This will begin from the assumption that women's employment situation is influenced by the way in which economic activity in the society is structured and by their role within the family, which has a specific position in the social structure. The concepts and problems related to women's participation in the work force are discussed and clarified below.

2. Conceptual clarification and problems of definition

(a) Level of women's participation in work

Women's participation in economic activity can be evaluated only inadequately using conventional labour force statistics. This is basically due to two factors: the way in which economic activity is defined, and the way in which it is measured.

ILO states that it is difficult to apply to women's work the internationally devised criteria for classifying occupations. Under these criteria, to be economically active, to be a worker or to be a member of the labour force means producing certain quantities of economic goods which can be traded in the market, and certain quantities of monetary incomes.

/In contrast,

In contrast, housework by women is not considered as work in the economic sense, and accordingly is not recorded as such in labour censuses and statistics.^{6/} More specifically, the fact that activities related to housekeeping and looking after children are discounted as economic activities makes it very difficult to grasp the real nature of the work carried out by women. To this should be added the absence of a clear-cut distinction between free time and work, economic and non-economic activity, in for example the preparation of agricultural products for family consumption, or the care of young animals destined to be sold; paid services which replace the work of the housewife and the same activities when they are carried out by the housewife herself.

In short, the concepts used are ill-suited for recording the real contribution of women to economic activity, since their activities do not involve the production of goods which generate monetary incomes. Their productive function consists in providing services and processing goods for the everyday maintenance and reproduction of the members of their families.

This is why there is a current proposal for a new definition of economic activity, where the fact of working or not working is defined on the basis of whether or not there is a contribution to the survival of the family group. It should be emphasized that only in this way is it possible to grasp the meaning of women's work, which in most cases is carried out within the home and for the benefit of the family itself. It is also of interest to note that there is awareness of the difficulty of defining, and still more in weighting, the contribution of domestic work, since it may consist in activities as dissimilar as the few minutes taken by a child in laying the table or the two or more hours a day, every day, spent by the rural housewife on activities as varied as feeding the poultry, washing clothes, cutting wood, looking after the children, going to the market, tidying the vegetable garden, and so on.

^{6/} International Labour Office, Women power, the World's Female Labour Force in 1975 and the outlook for 2000 (Geneva, 1975). See also the document prepared by the consultants Zulma Racchini de Lattes and Catalina Wainerman, which includes an exhaustive discussion of this point.

Concerning the problems of measuring women's work, it should be noted that the work of the female population frequently goes unreported and/or underestimated. This happens in economic production, especially in agriculture, where no account is taken of female help in the fields or the services supplied by the family of the small landowner.^{7/} One writer even states that any attempt to gather information concerning women will be distorted by the cultural assumption that what she does is of secondary importance. This is reflected in the under-recording of women from their births to their deaths, and in undercounting of female employment.^{8/}

Another problem is that of women who work part-time and/or seasonally, and do not declare that they are engaged in paid activities.

Finally, mention should be made of the factors which affect female participation in the labour market. These may be grouped - for purely analytical purposes, since in fact they are mixed together and reinforce one another - into societal, group and individual factors.^{9/}

Societal factors refer to characteristics of the society in which the woman lives. They include, on the one hand, the structure of production and levels of employment and, on the other, the social division of labour by sex, which defines the types of activity accepted by women and the value attached to them.

This study analyses the way in which the social division of labour by sex accounts for the way in which women work. Subsequently it presents empirical data concerning their levels of participation in economic and household activity. There is also an analysis of the relationship between the country's level of development and rates of labour participation. It is also necessary to include here aspects related to existing legislation.

^{7/} See E. Boserup, "Employment of women in developing countries", in L. Tabah, ed., Population Growth and Economic Development, (Dolhain, Odina Editions, 1975).

^{8/} E. Boulding, S.A. Nuss, D. Lee Carson, M.A. Greenstein, Handbook of International Data on Woman (New York, John Wiley, Sage Publications, 1976).

^{9/} This report freely follows the approach proposed by PREALC, "La mujer y el empleo en América Latina" (Santiago, 1976), and applied in PREALC, "Participación laboral y condiciones salariales de la mujer en América Latina, Estados Unidos y Canadá", PREALC/121 (Santiago, 1978).

concerning both the prohibition of discrimination and the establishment of special protection which, in some cases, acts as a brake on the recruitment of women. The latter subject will be touched on obliquely under point C.

Group factors (either of groups of which the woman is a member, or of groups which serve as a reference for her) have an influence by creating objective conditions for behaviour and developing aspirations, expectations, orientations, appreciations and motivations to act in a given way. In this regard social class and the family group are of special importance.

Women do not fall within the structure of production in an isolated manner, but do so through membership of primary groups, their families. Hence the importance of considering the role of women in the family and the place of the family in the social structure. The type of family, the family income, the division of tasks within the family, the area lived in and the social class are examples of important elements.

Individual factors include personal characteristics of the woman, such as age, civil status, level of education. Their concrete influence will be seen when the present situation in Latin America is described.

Two of the factors which influence women's work - the organization of the structure of production and the family - are discussed below in some detail, in view of their particular importance.

(b) Organization of the structure of production and women's participation in work 10/

It will suffice for the purposes of this study to mention that the politico-economic systems form the more general framework which defines the objectives and the role of the structure of production and its links with the forms of political organization.

10/ For a short development of the subject, see Eva Alterman Blay, Trabalho Domestico: A mulher na industria Paulista (São Paulo, Edit. Atica, 1978), especially pp. 29 to 42. Carlos Borsotti, "Situación de la Mujer y Desarrollo: Acotaciones" in Paz Covarrubias and Rolando Franco, Chile: Mujer y Sociedad (Santiago, Alfabetá, 1978). Irma Arriagada and Johanna Noordam, "Primer Simposio Mexicano-Centroamericano de Investigación sobre la Mujer. Análisis de las principales proposiciones, y bibliografía comentada", (CEPAL, Santiago, 1978) (typed version).

The characteristics of the structure of production are determined by the stage of development attained by the various branches of economic activity, and by the division of tasks which constitutes the occupational structure. This delimits the possibilities of work open to the members of a given society. However, a parallel factor is the division of labour, which imposes a hierarchy among the various tasks and the work opportunities socially accepted for the different categories of individual; in other words, it provides a social guarantee that certain categories of individual will undertake certain tasks, on the basis of a value judgement concerning their non-technical skills.

In short, the technical criteria for the division of labour - a division by branches of activity and a division of tasks into posts - are associated with hierarchical social relationships and judgements concerning which persons are socially suited to carry out specific tasks. The social division of labour uses sex as one of the principal criteria for drawing distinctions.^{11/}

The origin of the connexion between the social division of labour and differentiation of tasks by sex is a rather controversial subject, whose origins date back to the unknown roots of mankind. It is assumed that the social division of labour by sex is based on the differentiation between reproductive work and productive work, with the former allocated basically to women and the latter to men. It is also related to the distinction between domestic work and economic work; nevertheless, since as societies develop there is a certain tendency for productive work to become socialized and for reproductive work to maintain its domestic character, the former distinction will be preferred.

The differentiation between productive and reproductive work and its allocation to men and women respectively may be accounted for by relating it to the fact that women have the biological function of bearing children, nursing them and caring for them; meanwhile, men seek sustenance for both mother and children. Therefore it is taken for granted that generational

^{11/} Others include access to knowledge, the predominance of strength or intellect, ownership of means of production and social class.

reproduction is associated with a wide range of tasks in processing goods and providing services for the daily maintenance of the members of the family and the generational reproduction of the members of society.

Up to this point there would seem to be a division of tasks where women specialize in the activities corresponding to the reproduction of the human world, and men in those related to the production of the world of productive goods and services. However, in addition the activities which fall to women are not compensated by money, prestige, knowledge, power, whereas male activities are the means of securing the greatest social gratification - leadership, wealth and monetary income, prestige.^{12/} In this way, a differential evaluation is added to the differentiation in tasks and specialization by sex. And what was a complementary relationship becomes, in addition, a hierarchical one.

The fact that different tasks are allocated to men and women means that they have different positions in work. Women are entrusted with maintaining and looking after the home and bringing up the children, which, in most cases, means that she will work exclusively as a housewife. Men are entrusted with carrying out what are known as economic activities.

Accordingly, behind women's participation in work stands the complex network of social relationships and norms which mould the social division of labour. At the same time there is a set of ideas which give these institutional arrangements the status of "natural" facts. This group of ideas ranges from relatively well developed formulations to male and female stereotypes which define the specific features of each sex.

It is also of interest to note that each type of task allocated to the sexes requires different psychological characteristics; in order to ensure the existence of individuals with the appropriate characteristics to carry out these tasks properly, they are socialized in such a way that they manifest these characteristics and wish to perform the tasks which society defines as appropriate for them.^{13/}

^{12/} Jorge Graciarena, "Notas sobre el problema de la desigualdad sexual en sociedades de clase" in CEPAL, Mujeres en América Latina (Fondo de Cultura Económica, Mexico, 1975).

^{13/} Graciarena, op.cit.

Sex stereotypes are a simplified version of the set of tasks to be performed by each sex. In general it may be said that the female stereotype comprises the features suited to the affective function (sensitive, emotional) and that of looking after the home (patient, resigned, and so on); the male stereotype includes those which are relevant for maximum performance in the task of production (innovative, competitive, calculating, and so on). These examples are merely illustrative, since the specific content of stereotypes varies from one culture to another. Indeed, one of the present features is that they are being changed by various factors, including women's access to education, their integration in the labour market, egalitarian ideologies and social movements which publicly question them. At all events, whatever their specific content, their importance lies in the fact that stereotypes are transmitted and that individuals internalize their content, making it part of their self-image and a guide for their behaviour, thus closing the circle which tends to maintain the status quo.

A different way of looking at the matter involves estimating the significance of the contribution provided to society by the woman through her work. Leaving aside the most obvious contribution of reproductive work - the production of new generations - this work generates use values (processes goods and provides services) which together fulfil the role of reproducing, from day to day, the members of society and, among them, those who make up its labour force. In this way the housewife indirectly contributes to production.

Reproductive work is for the most part carried out by housewives, unpaid, and domestic servants. The importance of this type of work may be quantified in terms of the population engaged in it (see table 1). The contribution of housewives may be estimated through a simulation exercise calculating the amount of resources which the society would have to devote to pay those carrying out such tasks. (Table 1 provides the data on the basis of which the magnitude of the respective figures can be deduced.)

Finally, it is of interest to underline the practical consequences of the foregoing for women. The first is that, as a classical author on the subject, put it "in no society are men and women free to choose any

b/ Including family workers, except for those in the tertiary sector.

c/ Including the tertiary sector, except for domestic servants.

d/ Including housewives and female domestic servants.

/work they

work they wish to do, using the criterion of efficiency, suitability and capacity".^{14/} There are typically female or male occupations, and the latter are in a higher category than the former.

The second is the scant progress represented by the fact that women are legally permitted to occupy any post, since in practice they are going to perform some jobs and not others because the job market will offer them to women first and foremost, and because they are socialized to orient themselves towards specific jobs.

The third is that women contribute to society principally through their unpaid domestic activities, which are not computed in the labour force or in the national product, even though it is this work which enables the society to ensure that its work force receives, free of charge, the services needed to maintain it from day to day - laundry, food preparation and so on - and guarantees the reproduction of its new members; birth, care and, in part, socialization of children.^{15/}

The fourth is that behind participation in work stand the norms, values, ideologies, stereotypes and self-images which shape the guiding principles of the social division of labour by sex. Hence the mere fact that a woman enters the labour market, acquiring economic independence, solves only part of the problem, since it leaves untouched the aspects relating to values. This is reflected in the types of occupation in which women engage, and in the fact that, despite performing paid work and providing an income to the joint household, she is still obliged to carry out the housework.

(c) Organization of the family and women's participation in work

As a mediating institution between the individual and the society, the family is particularly important as regards the situation of women, "and the possibility of broadening their social participation, and eliminating the factors of the discrimination against them".^{16/}

^{14/} W.J. Goode, La Familia (Mexico, Uteha, 1966), p. 154.

^{15/} See Marshall Wolfe, "La participación de la mujer en el desarrollo de América Latina", in CEPAL, Mujeres en América Latina, *op.cit.*

^{16/} RPA, paragraph 35.

In the first place, it should be noted that the consequences of the social division of labour by sex mean, within the family, that the wife generally receives no monetary income, and therefore comes to depend economically on the husband. Furthermore, her activity is limited to the framework of the home, with the consequent limitations on contacts with others and participation in the activities which play a role in national life (fundamentally trade union and political activities).

Secondly, families mediate between the woman and society and, depending on the socio-economic stratum to which they belong, develop approaches to life whereby they organize and use the resources they have for the daily maintenance of the members of the family, and structure the demands which they make on society. This has an influence on the conditions in which the woman's work is carried out (housing, infrastructure of basic services, tools and raw materials), on the size of the family income and on the need for different members of the family group to contribute to that income.^{17/}

Before concluding this chapter, it should be emphasized that this form of conceptualizing women's work requires data of a different nature from those currently available in order to describe the present situation.^{18/} Consequently, the conceptual clarification set out above serves solely as a general orientation to interpret the real situation of women, which is, however, described below not as would be required by the concepts outlined but, on the contrary, viewing women as a category and an isolated entity.

In view of the role played by employment in relation to the situation of women, and the action proposed in RPA to improve the conditions which

^{17/} See Carlos Borsotti, "Notas sobre la familia como unidad socio-económica", Cuadernos de la CEPAL, N° 22, 1978.

^{18/} In order to make up such deficiencies, specific research is being carried out at the microsocial level, with a more anthropological approach. At the societal level there are plans to correct this by changing the way in which census information is collected. In this regard, mention may be made of the Seminar recently carried out (November 1978) by IUPERJ in Río de Janeiro, with the aim of making suggestions in this direction. Another initiative which deserves mention is the preparation of household registers, initiated by CELADE. See in this regard the documents by the consultants Recchini de Lattes and Wainerman, op.cit.

affect women, it is necessary now to examine some of the characteristic trends in the situation of employment in the region in the period 1960-1970:^{19/}

(i) The Latin American economies lack the dynamism necessary to absorb their populations of working age. This means that there is a labour surplus, which produces unemployment and, above all, chronic underemployment. PREALC estimates that about 27% of the total labour force is underused.^{20/} This situation is tending to become more serious because of the rapid growth of population and the high proportion of young people in it.

(ii) Latin American countries have reached different degrees of industrialization, and there is a distinction within the countries between a formal sector, with modern technology and high productivity, and an informal sector. All this produces very heterogeneous and diversified employment situations.

(iii) The middle and high occupational strata have grown rapidly, and this has been accompanied by increasing differentiation in wages (which favours the higher sectors) and a growing concentration of income, which tends to favour capital to the detriment of labour.

^{19/} See CEPAL, "Desarrollo humano, cambio social y crecimiento en América Latina", Cuadernos de la CEPAL N° 3 (Santiago, 1975). ^{20/} PREALC, op.cit.

B. CHARACTERISTICS OF THE EMPLOYMENT SITUATION OF WOMEN,
1960-1970

The specific features of the social division of labour mean that most of women's activities are not regarded as activities of economic significance, either for society or for the family. Hence the first point which must be dealt with concerns levels of participation in economic and household activities. This is followed by a study of women's participation in the labour market, bearing in mind that this participation is determined by the degree of development of the structure of production, the place of women in the family and the position of the family in the social structure.

1. Women's participation in work

(a) Level of participation in economic and household activity

If one considers solely the rate of women's participation in economic activity - defined as the number of women in the labour force compared with the total number of women of an economically active age - the low number of women in the labour market is surprising. Table 2 shows that the proportion of women in the labour market fluctuates around 20%; that is, barely one in five women of working age are involved in economic activity. Most of the remainder are engaged in housework.^{21/}

Accordingly, it is of interest to observe what would happen if it was considered that the role of a housewife represented work (see table 3). The first noteworthy point is that, with this new conceptualization, a higher proportion of women than of men are found to be working. This is due, firstly, to the fact that a smaller percentage of women enter higher education, and that there is a small percentage of pensioners among them; and secondly, that these figures overrepresent female activity because the tasks of housewives do not mean the same for all those engaged in them. For example, for the woman in a high socio-economic stratum, they can mean two or three hours a day of giving orders and supervising; on the other hand, for a peasant woman in a low stratum they may represent twelve hours

^{21/} It should be noted that not only is this proportion much lower than in other regions, but in addition, once women leave the labour market they do not generally rejoin it.

/or more

or more a day engaged in the widest possible variety of tasks, from feeding the domestic animals to preparing meals, as well as washing and ironing clothes, looking after the children, watering the vegetable garden, and so on.

With this proviso, which fundamentally modifies the significance of the data presented in table 2, it is necessary to emphasize some features which have been observed: (i) the female participation rates vary greatly from one country to another (between 14 and 30% in 1970), while male rates are more constant; (ii) in the 1960s the average growth rate of the economically active female population was higher than the growth rate in the female population,^{22/} which indicates a tendency towards greater female participation in the labour market. It should be pointed out, however, that there are countries where the reverse occurred.

The next section contains a study of how some of the factors outlined in the previous chapter affect female participation. It also analyses the participation rate by age group, civil status and type of structure of production.

(b) Factors affecting participation in work

(i) Activity rates by age. It can be seen from table 4 that women's activity rates are highest between 20 and 24 years of age, gradually falling thereafter. It should be remembered that it is around that age that most women establish a household and assume the responsibilities related to the role of housewife; this, as has already been said, competes with her remaining in the labour market as far as the orientation of her activities is concerned. The truth of this assertion may be verified in the following section.

Comparing this behaviour with that of males, it is noteworthy that men between 20 and 54 years of age have relatively constant rates of participation of over 85%; they subsequently decline. Women in the period

^{22/} The annual growth rate of the female population between 1950 and 1960 was 2.8%, and the figure for the period 1960-1970 2.7%. On the other hand, the growth rate in the economically active female population was 2.7 and 3.5%, respectively. Data published in OAS, "Women in the Latin American Labour Force", Fifth Conference of Ministers of Labour, Guatemala City, 1975, p. 5.

^{a/} The absence of some countries from the table is due to the lack of census data in the source used.

^{b/} 30-39 years.

^{c/} 40-49 years.

^{d/} Excluding the Canal Zone.

/of greatest

of greatest labour activity - 20 to 24 years - reach participation levels of 17 and 64%, with figures between 30 and 40% the most frequent.

Comparison of the specific participation rates for each age group set out in table 5 shows that the increases in the female participation rates are principally due to growth in these rates among women in the age groups under 44 years. This may be interpreted as an indication of the gradual change towards greater readiness to accept the entry of women into the world of employment. In various cases the increase is also occurring between 45 and 54 years of age; this may be interpreted as an indication of the entry of widows and separated women, which is discussed in the next section.

(ii) Activity rates by civil status. Table 6 gives data for some countries. In all of them it may be observed that the smallest proportion of active women occurs among married women, which corroborates what was said above. The rate of entry into economic activity among married women is two or three times lower than that of single women. Divorced or separated women, who generally assume the role of heads of household, have the highest rates of participation. This is related to what was said above concerning the family and, within it, the allocation of different tasks to the man as the husband, and to the woman as the wife. The latter is entrusted with household affairs, and this prevents her from entering the labour market. Nevertheless, when the husband is absent, there is no one to carry out the work which generates income essential for ensuring the sustenance of the family; this work must be undertaken by the woman in addition to her own work. This means that a female head of household has two jobs: as a remunerated worker and as a housewife.

(iii) Activity rates according to the degree of development of the structure of production in the countries. Efforts are being made to study the influence of economic development on the participation of women in the labour force. On a basis of Boserup's hypothesis,^{23/} which asserts that the modernization of the process of production in the countryside shifts

women away from economic activity, condemning them to domestic tasks.

Blay highlights the importance of the degree of industrialization reached.^{24/}

In order to check her hypothesis she uses the classification of Cardoso and Reyna ^{25/} into countries which were early industrializers (Argentina, Chile and Uruguay); recent industrializers (Brazil, Colombia, Mexico, Peru, Venezuela and Costa Rica); and incipient industrializers (Bolivia, Ecuador, El Salvador, Guatemala, Haiti, Honduras, Nicaragua, Panama and Paraguay). Blay finds that the distribution curve of female participation according to the degree of industrialization of the countries is in the form of a "J". In other words, in the countries regarded as early industrializers there is a higher female participation rate than in the recent industrializers, but at all events lower than in the countries with agricultural economies. She concludes that the effect of industrialization in its initial stages is to shift women aside from economic activity. Because this assertion is not consistent with the evidence provided in table 2, it must be regarded as at best a hypothesis which calls for further research.

2. Structure of women's employment

With a view to description, the employment of women will be examined in relation to the branch of economic activity in which they work, the occupations they engage in and the types of requirement and the compensation they receive for their work.

(a) Women's employment by branch of activity

Table 7 permits a comparison of the situation in 1960 and 1970. This comparison proves rather difficult, since the definitions used are different between one point and the other; as a result it is only possible to indicate some general features.

g/ Including those seeking work for the first time.

h/ Data prepared on the basis of the Yearbook of Labour Statistics (Geneva, ILO, 1974).

i/ Employed women only; excluding those for whom no information is available.

(i) In almost all the countries the percentage of women employed in agriculture fell, basically as a result of modernization of the systems of production in agriculture.^{26/}

(ii) The average in the industrial sector remained roughly constant. If the situation is examined country by country, one may observe that in almost half the countries the percentage of female employment increased, while in half it fell. The hypotheses concerning the degree of industrialization of the countries are of no use in interpreting this phenomenon, since it is in the earliest industrializers that the percentage of women fell. The explanation might lie in the small cottage industries and artisanal workshops in the less industrialized countries.

(iii) There is a notably high percentage of women who fall into the category of "unspecified activities", which is indicative of the problems involved in categorizing the many activities carried out by women.

Table 8 permits a comparison of the percentage distribution of employment of men and women. It is noteworthy that there are sectors of economic activity which are relatively open to giving employment to women, and others which are more closed. The sectors closed to women are: mining and quarrying, construction, electricity and gas, transport. The relatively open sectors are: industry, and to a lesser extent commerce, and services, which, in most of the countries, employ predominantly female labour.

The above assertions are confirmed by the information in table 9, which indicates that services are the main activity in which women are engaged. Depending on the country, between 40% and 55% of employed women may be found in the services sector. This is followed by industry (between 10 and 20%), and in third place commerce (between 6 and 18%) - which, moreover, is gaining in importance as a source of employment for women. Finally, it should be pointed out that agriculture has declined in importance as a source of employment for women, employing between 3 and 20% of total female labour, depending on the country.

^{26/} Comments on and interpretations of this phenomenon may be found in Ulrike von Buchwald and Ingrid Palmer, Monitoring Changes in the Conditions of Women, Geneva, UNRISD/78/C.18, 1978.

/In view

In view of the importance of the services sector as a source of female employment and the variety of activities it encompasses, it is necessary to break it down into subsectors. The breakdown is given in table 10, which highlights the importance of domestic service. Of the total number of women employed in services, between 54 and 73% are domestic servants, and of the total number of women employed in non-agricultural sectors, between 31 and 45% are domestic servants.

It has been established that, in general, domestic servants have a lower level of education than the average urban woman, and that unqualified, single rural-urban migrants predominate among them. The work they do has very little prestige, and their wage level is very low. Furthermore, they tend to be overlooked by labour legislation.^{27/}

The fact that a third of women are employed as domestic servants and a third as professionals and office workers suggests a close relationship between the two figures: the domestic work carried out by the former enables the latter to enter the labour market.^{28/}

Finally, it is necessary to describe the structure of production in the countries in terms of the distribution of the population as between activities which produce goods and the maintenance and reproduction of the individuals who make up society, at both the social and the domestic level. This has been carried out, more for illustrative purposes than in order to draw conclusions, in two countries for which information was available. Table 10 shows that the division of labour is relatively similar in the two countries: of every 100 workers, 32 are engaged in social productive work, three in domestic productive work, 20 in social reproductive work and 45 in domestic reproductive work.

Within this form of structuring the work of society, there is a specialization by sex. Women carry out 18% of social productive work, 50% of domestic productive work and social reproductive work, and practically all the domestic reproductive work. In other words, the fundamental task of women is to carry out domestic reproductive work (83% of women are engaged in it).

Note: There is a slight discrepancy between these figures and those in table 8 because of adjustments in the age of the EAP and rounding.

(1) Percentages of the female total in the services branch.

(2) Percentages of the total urban female economically active population.

a/ Including Armed Forces and police.

b/ Including education, health and social security.

(b) Female employment by occupational stratum

Between 1960 and 1970 it was observed that a substantial percentage of women reached the medium and high levels of the occupational structure, and that proportion was much higher than the increase in access of men to those levels (see table 11). This represents an improvement in their status vis-à-vis men; however, its real significance will be seen in the following pages. Table 12 indicates that there are two occupational groups to which women have majority access: professional and technical jobs and jobs in services. Some way behind stand office jobs. This confirms what was seen in the previous table, and offers grounds for stating that the changes represent an increase in the groups of non-independent professionals and office employees; there also appears to be a suggestion of a decline in the number of workers in services, which is confirmed by the information set out in table 14.

From a more detailed analysis of the place occupied by women at the various levels and occupations in the occupational structure (table 13), the above statements can be made somewhat more specific. It should be emphasized that about 10% of working women in the region work as non-independent professionals; this is reinforced by the university courses most followed by women, which are most likely to train them for work as teachers, nurses and so on.^{29/} About 12% are employed as office workers and sales staff in commerce, and somewhat more than 26% as domestic servants. The remainder, in smaller percentages, are distributed throughout the other occupational groups.

The principal differences compared with men lie in the fact that, at the middle and higher levels, greater percentages of men reach jobs as employers and managers; at the low levels, on the other hand, they work more frequently as manual workers, in the primary and secondary sector. This indicates, firstly, that men take most of the decisions as employers and managers, and, secondly, confirms the earlier statement that the predominant role of men is to carry out as what is regarded as productive work.

^{29/} See table 1 in Marshall Wolfe, "La participación de la mujer en el desarrollo de América Latina", in CEPAL, Mujeres ..., op.cit.

The information is based on standardized samples from the censuses. Processed by Irma Arriagada. Las mujeres pobres latino-americanas, Estudios de Población, vol. II. No 8.

- a/ Basically female domestic servants and other female wage earners in services such as waitresses.
- b/ In El Salvador in 1970 the "others" category was 4% for women. For this reason it was not taken into consideration.
- c/ In the Dominican Republic in 1970 the "others" category made up 42% of the total. For this reason it was taken into consideration.

(c) Use of requirements for and remuneration for female employment

The factors which contribute to the underuse of labour are: the fact that permanent and appropriate work cannot be found, that higher qualifications are demanded than those necessary for the work, and that lower remuneration is received for the work carried out.

Open unemployment affects women twice or three times as much as men,^{30/} and this is more dramatic when the woman is the head of a household.

In previous studies it had been said that women join the labour force with a higher level of education than men. However, the data set out in table 15 modify this assertion, when each stratum is considered separately. It is true that, when the labour force is considered as a whole, there is a lower percentage of women without education and with less than three years of primary education, and that, at the other extreme, there is a higher percentage of women with 10 or more years of education. Nevertheless, in a more thorough analysis, when the average number of years of education of men and women is examined in each occupational stratum, it may be observed that women possess less education than men, with the exception of two strata: workers on own account and office workers and industrial manual workers. It might therefore be supposed that, in order to enter the production units, either as an office employee or as an industrial manual worker, a woman is expected to possess higher qualifications than a man; it may also be suggested that a woman who decides to work in such jobs, instead of working in other, more conventional jobs, for example as a domestic servant, belongs to a sector which has succeeded in gaining more education than other women. The two hypotheses are not mutually exclusive, but support one another.

If the professional stratum, which exerts substantial influence in raising the average number of years of education possessed by women, is considered separately, it is clear that the average number of years of education among women is lower. This may be explained if it is remembered that the professions in which women are concentrated, such as nursing and teaching, require shorter studies.

Source: Census sample operation, OMUECE: UNESCO-CEPAL-UNDP: Project on Development and Education in Latin America and the Caribbean. The information is based on standardized samples from the corresponding censuses.

Table 16 shows that a small percentage of women attend courses of technical training (about 25% of the total number of pupils).

Finally, women are paid less than men for their work. This may partly be accounted for because they have less training; nevertheless, part of this differential has no justification at all. This is true, for example, of female manual workers in industry, since, as has been pointed out, women in this stratum are better educated than men. A possible explanation is not that women are paid less than men, but that they carry out tasks which, under the prevailing criteria, earn lower remuneration. Hence it may be said that the problem lies in the fact that the typically female occupations are regarded as deserving lower remuneration. Consequently, the nub of the problem lies in the criteria used to establish the relative status of jobs and their differential remuneration.

(d) Attitudes to working women

The picture will be completed by an examination of the significance and extent of social acceptance of the employment of women, including a brief outline of the attitudes of employers to working women, and those of women themselves to their roles as workers.^{31/}

In general, employers state that they have no prejudices against engaging women; however, when the time comes to select their staff, they prefer men to women. The reasons adduced are additional costs - maintenance of nurseries - and possible disruption of production, specifically maternity leave, absence to look after family members, difficulties in working unusual hours, and so on.^{32/} When asked about promotion of female staff, they stated that opportunities are very limited, because women do not possess skills in command, organization and planning.

^{31/} This information is derived from interviews carried out as part of CINTERFOR Project 102, "Professional training of working women", carried out in 1975 and 1976. The interviews, which constituted one of the techniques used in the project, were carried out in Brazil, Colombia, Costa Rica, Mexico and Venezuela.

^{32/} Hence many solutions which would facilitate access for women to the labour market, such as flexible working hours, part-time work, and so on, must be raised with great care and never as a privilege offered to women.

/These views

These views should be compared with the attitudes of women themselves to work. The way in which women take up work reflects the way in which they define themselves socially; and the way they conceive their roles as workers is, in turn, a cause and effect of their so far secondary position in the labour market.

The reasons for which women work vary with their socio-economic level: at the low level, the wage is the most important factor; at the middle level, economic independence and a contribution to the family income; at the high level, personal and professional fulfilment have priority.

However, it should be remembered that whatever the reasons which lead them to seek employment, the elements which go together to define the image that society has of women and that women have of themselves are laid down by the prevailing form of the social division of labour, which assigns housework to women and productive work to men. Socialization conditions women to assume this role, to develop more passive personality features and to accept a degree of submission to men. Consequently, it is understandable that a high percentage of women should regard their work exclusively as a means of overcoming the economic problems of the home, defining it as temporary in relation to their major ambition, which is exclusive dedication to their home. Similarly, this is reflected in the general opinion that a woman with children should not work, even though many are obliged to do so.

It is also understandable that women should prefer occupations which in some way are related to the activities involved in managing a home or which involve services to others, i.e. which represent a transfer to the labour market of the activities they carry out in their homes. In other words, women choose the occupations which they have traditionally carried out because of the cultural conditioning they have received and the possibilities of work offered by society. In this way they select those jobs in which they know they will be welcome and which are not inconsistent with the activities socially defined as female. They work as professionals, choosing to be teachers or nurses; as office employees in middle-level secretarial or administrative jobs; or else as domestic servants.

Finally, this is reflected in the differential importance attached to the remuneration received by women. Women's wages are regarded as a

/contribution to

contribution to the family budget, and it is accepted that they will earn little, since it is the man who should maintain the family. What is noteworthy is that this affirmation lacks any empirical foundation: from the interviews it was discovered that in a large majority of cases, the wages earned by the women amounted to 50% of the total family income, so that it is clear that their contribution is vital for the sustenance of the family group.^{33/}

In addition, it should not be forgotten that there is a percentage of women who are the sole support of their household.

In short, it may be said in general terms that with the maintenance of the sexual division of labour there has been no significant change in attitudes towards women's work, nor in the definitions of women's tasks, nor, as a result, in discrimination in remuneration and the worth society attaches to their work.

C. RECENT DEVELOPMENTS

To sum up the descriptions provided by CEPAL,^{34/} it may be said that the period at the beginning of the decade was characterized by high rates of economic growth and by very high prices for the region's exports, factors which stimulated consumerism and the national industries which feed it, and which "permitted the state to relieve social tensions by expanding social services, assistential programmes, and above all by absorbing in public employment an important part of the rising output of secondary and higher education".^{35/}

Starting in 1974 the effects of the rise in petroleum prices were felt together with those of the consequent recession in the central countries, and this was reflected, as far as the countries of the region were concerned,

^{33/} This is endorsed by the study carried out by Eva.A. Blay, *op.cit.*

^{34/} CEPAL, "Desarrollo y Cambio Social en América Latina", Cuadernos de la CEPAL N° 16 (Santiago, 1977). CEPAL, "The economic and social development and external relations of Latin America", E/CEPAL/1024, 1977.

^{35/} Ibid., p. 59.

in a worsening in the terms of trade, a decline in the rate of economic growth, difficulties in servicing the external debt, a reduction in government resources for public expenditure and an increase and spread of inflation. In turn these phenomena produced: (a) a rise in open unemployment, creating serious obstacles to the integration of women and young people wishing to enter the labour force; (b) a decline in government revenues, which led to a slow-down in the expansion of education, especially higher education, together with government campaigns aimed at freezing and/or reducing bureaucratic employment, thus restricting job opportunities for the middle strata; (c) the adoption of austerity policies and the growing removal of restraints on market forces, which deprived the government social policies for income redistribution of importance. It should be pointed out that this harmed the programmes aimed at improving the status of women. In the name of efficiency social problems were subordinated to the need for manpower and to the capacity of the various social strata to pay, thus discriminating against the lower-income sectors.

The material to complete the picture concerning the recent situation of women's employment was to have been derived from the government replies to the questionnaire on progress achieved in the implementation of RPA. However, these replies almost all relate to legislative aspects of a rather general nature, without contributing specific information in this field.

In the labour field, legislative action is directed, firstly, towards the achievement of equality in work for men and women; to this end it establishes equality of opportunity, the principle of equal pay for equal work, and eliminates discriminatory factors. Secondly, legislation is established which seeks to protect women as regards working hours and heavy or dangerous work, or in relation to their function as mothers, granting them, for example, maternity leave and time off for nursing.

In this regard the provisions of RPA are relevant. It warns that excessive protection may in practice result in a limitation of real opportunities for the employment of women.

In passing, it is of interest to emphasize that there are still countries in the region which restrict women's activities to their functions within the home; as a result, the husband may legally object to his wife's being employed.

D. PRINCIPAL PROBLEMS

It is of interest to emphasize which are - and, as far as can be seen, which will be by the 1980s - the principal employment problems affecting women. For this purpose the various aspects related to employment are briefly reviewed below, and the specific problems of each of them are highlighted.

Concerning the low level of participation by women in economic activity, it should be emphasized that the principal problem is that women are regarded as non-active even when they are performing a task which is essential for the functioning of their families and society, since the work is not defined as an economic activity, even though it fulfils an important economic function by creating use values; it is not recorded as a contribution to the national product, does not generate income and enjoys little recognition by society.

This basic problem has repercussions at various levels, leading to concrete problems which vary with the degree of development of the countries and the social stratum of the woman.

In the family, the husband supplies the money and the woman is in a relationship of economic dependence. If, in addition, her activities are defined as being of secondary importance, the relationship established between husband and wife is that between a superior and an inferior. The man is the head of the household, the woman depends on him and must submit to him. In this way the relationship between man and woman tends to be a dependent and authoritarian relationship, with all the psychological problems that implies and with the consequent erosion of the dignity of the woman as a person.

As a housewife, the woman is looked down upon in her home - particularly in the case of women of a low socio-economic stratum, and less so in those of a high stratum, who can engage domestic servants - and this means that she carries out her activities in an environment lacking in incentives, that she does so in isolation, that her tasks are routine ones and that the interests they generate tend to be limited to the home. All this makes it

/difficult to

difficult to engage in "the collective reflection" 36/ which is necessary to interpret her circumstances as a social phenomenon, to take an interest in discussing the problems of her society and to participate in political activities.

At the level of society, it should be remembered that these facts originate in the prevailing division of labour, which assigns to each sex different activities which are unequally valued even though they are both indispensable. Changing this division of labour means, firstly, reorganizing the very foundations of the economic system and, secondly, revising the cultural foundations on which the differential evaluations are based. Hence the complexity of the problems relating to women's work, and unwillingness to face them properly.

Mention may be made of some of the various concrete problems whose particular characteristic is that they are very interrelated and tend to reinforce one another:

(a) The resulting structure of domination, at the level of the family, places the woman in a dependent and subordinate position vis-à-vis the husband and/or the father; at the level of society it limits her access to decision-making positions, relegates her to the home or else restricts her job opportunities to the occupations regarded as "female", in other words those with lower prestige and poorer pay.

(b) As the activities allocated to women are defined as being of lesser importance, the woman comes to be regarded as a person of less significance and therefore as unsuited for carrying out leadership tasks. Hence the problem of her exclusion from management posts and from the political decision-making process.

(c) This idea, based on the allocation of unequally evaluated tasks, comes to form an ideology; the ideology is transmitted and acquires the status of knowledge. Meanwhile, by being taught as how matters are and should be, it influences the behaviour of individuals. Women are socialized

36/ See Hohanna Noordam, "La mayor integración de la mujer en el desarrollo en el área rural de América Latina" (Santiago, CEPAL), (preliminary document).

in such a way as to develop certain psychological features and inhibit others, which makes them more suited for carrying out the tasks which are defined as "female"; they aspire to certain careers and not others; when they look at themselves as women, the principal value is to be a housewife, and this increasingly clashes with what they value if they see themselves in terms of other categories; for example, as students, professionals, and so on. Hence the unwillingness of women to accept changes in the traditional definition of their role, and the contradictions to which they are subject.

(d) The persistence of these conceptions in male and female stereotypes tends to classify individuals in tasks and attitudes which may not be suited to their aptitudes. This causes psychological tensions and social problems because of the poor use made of human resources; limits the woman to the home, with the problems described above, and to certain occupations; and, finally, helps to legitimize and perpetuate existing conditions.

There is a second group of problems which relate particularly to women who belong to the labour force. As women, they share many of the problems set out above, plus those indicated below. It should be pointed out that RPA lays down as an objective the incorporation of women in employment. However, this aspiration is problematical in a region where unemployment and underemployment are chronic and very high, unless the style of development is radically changed so that it is capable of generating enough jobs to absorb natural growth in the labour force, and also the increase resulting from the entry of new groups of women.^{37/} Such a change in the style of development is highly unlikely to occur, according to various prospective studies carried out by CEPAL. Thus serious reflection is necessary on this point: if access to remunerated work is viewed as a means of liberating women from their subordinate position, it should be borne in mind that alternative forms of women's liberation exist, some of which are more feasible;

^{37/} The most recent projections by ILO reveal substantial increases in female participation rates between the next decade and the year 2000, especially in the 20-24 and 25-44 age groups. In the first group, the increase in participation rates for Latin America between 1975 and 2000 would be 42.5%; in the second, 30.2%. Quoted by Henry Kirsch, "El empleo en América Latina: mirada retrospectiva y perspectivas para el futuro", E/CEPAL/DS/183 (Santiago, 1978), p. 43.

if, on the other hand, it is viewed as an ineluctable requirement of survival, principally for women who are heads of household, specific measures become necessary, which are indicated under point E.

When the case of women who are already in the labour force is analysed, three problems stand out:

(a) The occupations in which they work correspond to the female stereotype; since these are tasks to which society attaches little value, they are badly paid posts which carry little prestige.

(b) The situation of the married woman with a job means that she has a double working day, except that she may be able to afford to engage a domestic servant to replace her in household tasks, or may have the help of a member of the family. The situation is worse still in the case of a woman who is the head of a household, who is obliged to work to earn an income.

(c) Women who are employed in the tertiary sector work in most cases as itinerant vendors and domestic servants. However, bearing in mind the rise in educational levels, one may suppose that these would not be acceptable jobs for new entrants into the labour force, whose aspirations would be greater.^{38/} This makes it likely that in the near future there will be social pressure on employment, which might lead to considerable social conflict if appropriate solutions are not reached promptly, in other words, solutions which make it possible to create sufficient jobs to employ the growing flow of women from the educational system.

^{38/} Henry Kirsch, op.cit., p. 42.

E. RECOMMENDATIONS AND SUGGESTIONS FOR ACTION

This section takes up again what has been said above in order to suggest a set of actions related to concrete programmes for action and research. It is designed to improve later evaluations and the sources of information available.

The root of the differences in the development of women's activities lies, as has already been said, in the social division of labour, with its specific allocation of tasks by sex and the different value attached to such tasks. For this reason, it is logical that any change in the working status of women should aim at transforming the social division of labour by sex. It has already been said that making this change means altering one of the structural foundations of the economic organization of society, as well as the cultural foundations of domination by sex. Hence the futility of dealing with the problems separately, the difficulty of dealing with them comprehensively and the unwillingness to carry out transformations which would perhaps involve one of the most radical peaceful revolutions in the history of mankind.

To this must be added that, in the case of the countries of the region, and because of the prevailing styles of development, it may be observed that the present systems of production are incapable of absorbing the existing economically active population, so that it is unrealistic to emphasize the growing integration of women in employment when one knows that it will run up against structural limitations which have not yet been overcome. Hence, at least for the next decade, it is considered better to tackle the problems by seeking to change the value society attaches to given tasks, rather than planning a radical change in the allocation of the tasks.

With this proviso, which identifies the real magnitude of the problems of women, it is recommended that measures should be taken on two fronts: housework by women in the home and their work in the labour market.

As far as housework is concerned, it is proposed:

(a) To revalue the function of reproducing social agents compared with the function of producing goods. This secures greater social

/recognition (prestige)

recognition (prestige) for activities carried out by women and, later, a readjustment in criteria for fixing remuneration.

(b) To publicize the value of the work of the housewife, emphasizing that this is an economic activity as essential for the functioning of society as is productive activity. It may be argued that, by giving greater prestige to the activities carried out by women, one would attach greater value to her, and to the extent that her value was increased she would be considered to be equal, so that the path would be opened towards a reduction in her present exclusion from the decision-making areas.

(c) To guarantee social recognition of the contribution of women to the welfare of the family group and appropriate compensation, either in cash or in services.

(d) To overcome, at the cultural level, the rigid division man/productive work, woman/reproduction and maintenance of the social agents, both in the family (allocating responsibilities and domestic tasks typical of both sexes to all the children) and in society, thus challenging the sex stereotypes which discriminate against women.

(e) To endeavour to free women from the heaviest domestic work by:
(i) organizing the community so as to provide some services in a socialized form, for example, nurseries; (ii) extending infrastructure services such as drinking water and so on, with the aim of ensuring that women have free time to relate to others, and to carry out activities which are meaningful and psychologically enriching, thus remedying the negative effects of the environment in which they work as housewives.^{39/}

(f) To train housewives in simple technologies which would enable them to perform housework more efficiently, and to train their families to co-operate with them in performing it.

As regards the work of women in the labour force, the following measures are recommended:

^{39/} Marshall Wolfe defines meaningful activities as that which individuals wish to do to fulfil themselves and that which is regarded as sociably desirable. In the case of this document it would be what is defined by the objectives of RPA.

(a) To combat the sex stereotypes which are an influence in women's being directed first and foremost to "female" occupations, which, because they are given less value by society, are worse-paid.

(b) To promote and increase attendance by women in training courses. It should be remembered that, in contrast to common belief, women have less education than men in the same occupation and almost no training. Care should be taken not to offer only the conventional specialities, such as fashion, hairdressing, and so on.

(c) To train women who are already employed so as to encourage their promotion to management posts, such as for example, from secretary to head of public relations, from cutter to workshop head, and so on.

(d) To revise protective legislation in the light of new knowledge and technologies, so as to discard that which discriminates between the sexes. Perhaps protection might be limited only to matters related to maternity (leave, retention of jobs, and so on).
