POSTWAR TRANSFER OF RESOURCES ABROAD BY LATIN AMERICA

UNITED NATIONS
ECONOMIC COMMISSION FOR LATIN AMERICA AND THE CARIBBEAN
Santiago, Chile, 1992

LC/G.1657-P
July 1992

This study is part of the *Economic Survey of Latin America and the Caribbean, 1989*, and was prepared by the Economic Development Division of ECLAC.

The following symbols have been used in the tables

Three dots (...) indicate that data are not available or are not separately reported.
A dash (-) indicates that the amount is nil or negligible.
A blank space in a table means that the item in question is not applicable.
A minus sign (-) indicates a deficit or decrease, unless otherwise indicated.
A full stop (.) is used to indicate decimals.
A slash (/) indicates a crop year or fiscal year, e.g., 1969/1970.
Use of a hyphen (-) between years, e.g., 1960-1970, signifies an annual average for the calendar years involved, including the beginning and the end years.
References to "tons" mean metric tons, and to "dollars" United States dollars, unless otherwise stated.
Unless otherwise stated, references to annual growth rates of variation mean cumulative annual rates.
Figures and percentages in tables may not necessarily add up to the corresponding totals, because of rounding.

POSTWAR TRANSFER OF RESOURCES ABROAD BY LATIN AMERICA

1. Latin America's external financing

In the late 1980s the countries of Latin America were net exporters of vast amounts of financial resources to the developed countries, a phenomenon that thwarts the aspirations of its peoples and confutes the principles of development and international co-operation.

Economic development and a bridging of the gap in productivity and well-being between the developing and developed countries require, in the first group, a sustained rise in investment, which is beyond its domestic savings capacity. Adequate flows of resources from abroad will therefore be necessary.

Furthermore, in view of the fact that increased investment leads to increased imports of capital goods and that the consequent expansion of the product generates in turn additional imports, external capital must also enhance import capacity in order to meet these increases in demand for imports.

Both direct foreign investment and long-term loans or unrequited official transfers fulfil this dual role of supplementing domestically-generated investable resources and providing foreign exchange to increase import capacity. With respect to loans or transfers, however, the problem usually arises of the capacity of the recipient economy to absorb financing from abroad, in other words, the problem of ensuring that such financing effectively results in productive investment and not in consumption.

Moreover, both direct investment and loans involve the prospect of outflows of resources in the form of remittances of profits and debt service payments. In the case of the former, such payments depend not only on whether profits are made but also on reinvestment strategies. In contrast, in the case of debt service payments, a contractual obligation exists on the part of the debtor to remit both the interest and the agreed amortization payments. The sustained financing of development, which exceeds the domestic savings capacity and the purchasing power of exports therefore

requires that inflows of foreign capital should always be greater than remittances abroad by way of payments for the servicing of such capital, thereby resulting in a positive net transfer of external resources.¹

The easy access to external financing in the 1970s came to a sudden halt in the 1980s, thereby significantly modifying the savings-investment process, pushing the external debt beyond sustainable levels and contracting import capacity. Latin America is thus entering upon the last decade of the twentieth century with a permanent drain of resources abroad, which compounds its difficulties in participating more actively in international trade—in circumstances in which the latter tends to be organized on the basis of large supranational groupings—and contributes, in turn, to a worsening of the severe domestic problems that hamper efforts to bring about changes in production patterns, State reform and the achievement of greater social equity.

a) *Investment and its financing*

The level of gross capital formation and the composition of its financing underwent significant changes in the last few decades. Investment remained steady at between 21% and 22% of the product during the 1950s and 1960s, while the domestic savings required to sustain that level necessarily increased mainly on account of the deterioration in the terms of trade. Gross domestic savings at 1975 prices thus rose from 23% of the product in the 1950s to 26% in the 1960s, since the real transfer by way of the terms of trade effect increased its negative impact by almost 3% of GDP. The average performance for the period 1970-1973 was similar, as the negative effect of the terms of trade, at 1980 prices, was almost 6% of the product. Since at the same time, the net payment of factors abroad exceeded 2% of GDP, a rate of domestic savings equivalent to 26% of the product was necessary in order to maintain the level of investment at 21% of GDP (see table 1).

During the period 1974-1981, the beginning and end of which coincided with the first hikes in petroleum prices and the commencement of the regional balance-of-payments crisis, investment reached its highest level since the 1950s—24% of the product at 1980 prices. This increase was mainly accounted for by foreign capital in an amount equivalent to 4% of GDP, which virtually offset outflows both by way of factor payments abroad and through the deterioration in the terms of trade. This period therefore witnessed the simultaneous increase in investments and the decline in domestic savings.

During the crisis, on the other hand, gross capital formation declined dramatically, and between 1982 and 1989 it stood on average at a mere 17% of the regional product, while domestic savings remained steady at 24% of GDP, despite the drop in the level of per capita activity. The principal cause

of this decline in investment was the sudden reversal in the net transfer of financial resources abroad, which represented an inflow of 1.6% of the product during the 1974-1981 period and an outflow of 3.5% between 1982 and 1989. This reversal, equivalent to five percentage points of the regional product, further compounded the situation brought about by the transfer of resources due to the deterioration of the terms of trade between these two periods, which was equivalent to a further three percentage points of the product. In such circumstances, the real transfer of resources abroad (at 1980 prices), which during the period 1974-1981 was slightly positive, became negative by an amount exceeding 7% of the regional GDP.

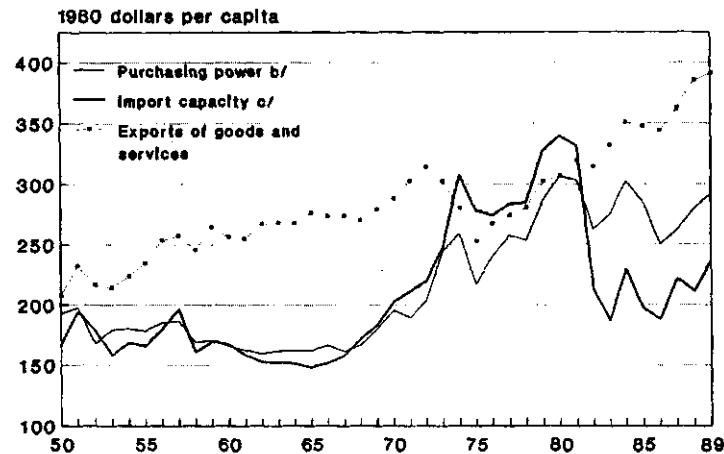

- b) *Import capacity*

The reversal of the flow of net external financing in the 1980s also severely affected the region's import capacity.² After remaining stagnant up to the mid-1960s and thereafter increasing until 1980, per capita import capacity in real terms declined sharply with the crisis (see figure 1). This evolution was the result of combined changes in the main factors that determine the external situation of Latin American economies, such as export potential, external demand, international prices and the net balance of financial resources received.

i) *Terms of trade and purchasing power of exports.* The volume of per capita regional exports showed an upward trend up to the early 1970s, then declined up to the middle of that decade, following which it entered upon a new phase of rapid expansion, reflecting the region's vigorous export drive aimed at achieving equilibrium in its balance of payments. In contrast, the per capita purchasing power of exports, which incorporates the terms of trade effect, showed a different evolution: purchasing power remained relatively unchanged between 1950 and 1970, increased significantly with the improvement in the terms of trade that occurred in the early 1970s, continued its growth up to 1980 as a result of the expansion of the physical volume exported and has subsequently been fluctuating below that level because of successive declines in the terms of trade (see figure 1).

At any rate, the purchasing power (at 1980 prices) was always less than the physical volume exported. This was very largely due to the high petroleum prices that prevailed in 1980, which meant that, at 1980 prices, the hydrocarbon-exporting countries recorded a significant negative difference in the terms of trade effect during the entire preceding period.³ This was not the case, however, in the rest of the region where the drop in the real prices of agricultural products and, to a lesser extent, of minerals, meant that the difference (at 1980 prices) between 1950 and 1980 in the terms of trade effect was positive for non-petroleum-exporting countries, particularly for the South American countries. In contrast, from the latter

year onward, following the decline in the prices of most export products –both energy and non-energy– of the region, the negative effect of the terms of trade became widespread.

ii) *The contribution of the net transfer of external resources.* The flow of net external financial resources also underwent different phases. For Latin America as a whole, its contribution to the financing of per capita import capacity was generally negative or nil up to the late 1960s, following which it became markedly positive. However, with the advent of the region's financial crisis in 1982, the net flow of resources from abroad became decidedly negative, which resulted in the per capita import capacity plummeting and remaining since then at a level 25% below the pre-crisis levels, or roughly at the average recorded by the region in 1971 (see figure 1).

The oil-exporting countries were instrumental in the net negative transfer of financial resources recorded between 1950 and 1970, while for the non-hydrocarbon exporting countries of South America the external transfer during this period was barely positive. During the 1970s and 1980s both groups repeated this general performance. The Central American countries, on the other hand, were able to maintain a favourable flow of resources from abroad during almost the entire period of four decades following the Second World War.

iii) *Real financing of import capacity.* The evolution of the terms of trade and of the net transfer of financial resources for the countries of Latin America as a whole during the postwar period thus defined three markedly different periods (see figure 1). Between 1950 and 1973, the total real per capita transfer at 1980 prices (covering the area between the capacity to import and the volume of exports) was decidedly negative, in its terms of trade effect (covering the area between the export curve at constant prices and the purchasing power of exports). Subsequently, between 1973 and 1981, the real transfer became positive, as a result of the huge inflows of financial resources (covering the area between the capacity to import and the purchasing power of exports) which more than offset the unfavourable terms of trade effect which were less favourable than that achieved in 1980. After 1982 total real transfers again became negative and reached unprecedented proportions on account of the simultaneous deterioration of the terms of trade and the huge net outflow of financial resources.

2. Changes in the international financial situation and Latin America's debt overhang

These developments occurred in the midst of the major changes of the 1970s in the international financial arena, beginning with the end to the convertibility of the dollar, followed by the substantial increase in financial

flows resulting from the expansion of the eurodollar market and the surpluses derived from the petroleum crisis, and culminating with the liberalization of interest rates in the United States market.

The accumulation of disequilibriums in the United States balance-of-payments position during the 1950s and 1960s culminated in the decision to legislate the inconvertibility of the dollar *vis-à-vis* gold in 1971. Moreover, during most of the 1970s regulated national markets existed alongside a booming informal market (eurodollars) in which fluctuating interest rates were accompanied by rapid financial innovations at the institutional and organizational levels as well as at the level of the management of instruments. In the late 1970s the Federal Reserve Board of the United States freed the maximum interest rate, which had been used as an instrument of monetary policy since the time of the Great Depression. The adoption of a contractive monetary policy in a context of major fiscal imbalances produced highly positive real interest rates, which constituted a fundamental change with respect to the previous situation.

These significant events created an unprecedented financial situation, with fluctuating exchange rates, wide variations in real interest rates and hefty financial surpluses held by the private commercial banks. The latter, with scant experience in granting medium-term credits to governments, needed nevertheless to recycle their considerable short-term deposits of petrodollars. For their part, the Latin American countries seeking credits also found themselves in a novel situation in which they obtained a flow of financial resources with unaccustomed ease. In such a situation, both the granting of loans by the banks and the utilization of external resources by the countries were far from being optimal.⁴ In some cases, consideration was not given to the possibility of obtaining a flow of foreign exchange with which to amortize loans in the same currency as that in which the debt was contracted; in others, both the public and private sectors accumulated excessive credits without taking into account the possibility of an abrupt cut-off in the flow of financing. All the actors embraced the idea that the available financing, the capacity to pay and the level of indebtedness were almost unlimited, an idea that was supported by the most widely held theoretical view of the time, which made no distinction between external transactions on current account and on the capital account of the balance of payments. There were few exceptions to this view, such as that of Colombia, whose external indebtedness was smaller than that of the rest of the region.

In this scenario, world supply of and demand for credit expanded rapidly during the 1970s. In Latin America, the greater demand for external financing –within this permissive framework– was partly a response to needs created by greater investment, but the credits obtained also fed expansionary fiscal policies aimed at sustaining high domestic demand, and financed the rapid expansion of private consumption and even –in certain

cases or periods— the flight of resources toward assets abroad (“capital flight”). The debt overhang of the countries of the region was offset by the considerable increase in exports, which in current dollars grew at an annual rate of 20% between 1971 and 1981, mainly due to improved prices.⁵

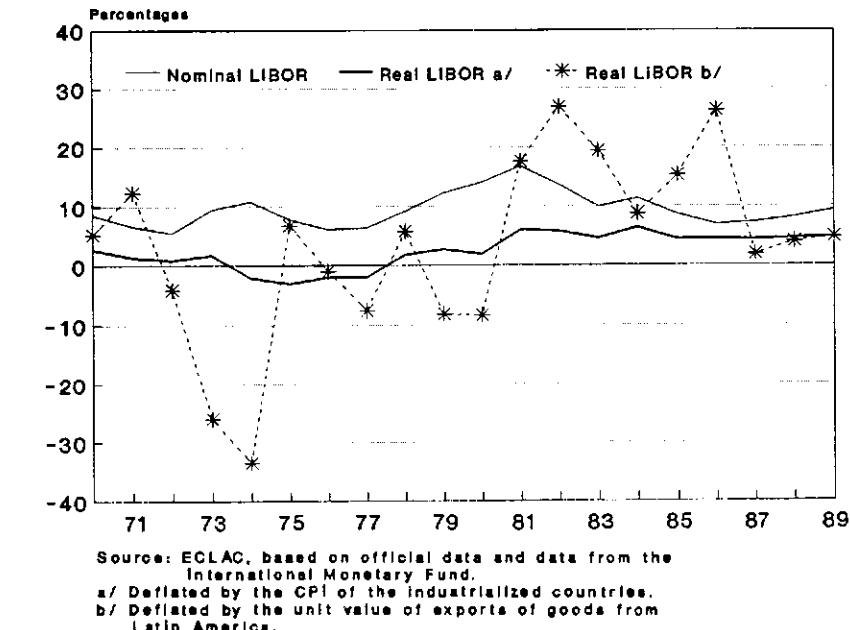

The increasing indebtedness of the region took no account of the changing situation in the industrialized countries, in which, in comparison with the 1960s, a structural decline took place in the rate of growth, followed by a substantive change in monetary policy. From the late 1970s onward, these countries placed more emphasis on their fight against inflation through restriction of aggregate demand, which led to a sharp recession with high real interest rates in the early 1980s. As a result, the product of the industrialized countries declined from a 5% annual rate in the 1960s to under 3% during the period 1974-1981 and to a scant 1% during the three year period 1980-1982. The Latin American countries, for their part, experienced a much slower deceleration of growth (see table 2). Unlike the strategy adopted by the economies of South-East Asia, which focused predominantly on export objectives, the larger countries of the region sought to maintain domestic demand by contracting further debt in the belief that the situation of high prices for their export products and low real interest rates, with abundant bank financing was a permanent one when in reality it was only short term.

This fundamental strategic approach was particularly influenced by the evolution of the real interest rate during most of the 1970s. This rate had been negative in relation to international inflation, and much more so if measured against the prices of Latin American exports. In the first case therefore a real interest rate of -2% was recorded for the average of the years 1971-1977. However, if the variation in export prices were used as a deflator, the real rate would be a minimum of -33% in 1974, which was due above all to the rapid increase in the international prices of raw materials, and particularly of petroleum (see figure 2).

In terms of the supply of credit, the new situation of the international banking system with a booming eurocurrency market (although this could hardly be sustained in the medium term), and the recycling of the financial surpluses derived from the rise in petroleum prices, led to an extraordinary expansion of the operations of the commercial banks in Latin America. In this sense, the expansion of the scope of action of United States banks—at that time the leading private international banks—in the region was a logical response, having regard to their geographical proximity, commercial ties and greater familiarity with the region, compared to other regions of the world.

In summary, the conditions that prevailed on the international financial market during the second half of the 1970s were equally attractive to creditors, who obtained large profits from interest on higher risk premiums

Figure 2
NOMINAL AND REAL INTERNATIONAL
INTEREST RATES

(which were up to 2% higher than regular premiums), and to debtors, who had access to abundant financing without the usual conditionalities imposed by international organizations. The latter maintained their traditional financial mechanisms but were incapable of intervening to any significant degree in the recycling of petrodollars. As a result Latin America actively contracted loans with the international commercial banks. The flow of long-term credit almost trebled between 1970 and 1973, and again between 1973 and 1978. In the three succeeding years it almost doubled in value. The net inflow of short- and long-term capital into the region as a whole thus peaked at US\$48 billion in 1981, equivalent to more than 40% of total exports in that year, as against only 14% in 1960 (see statistical annex).

Long-term external loans granted to public and private entities –and expressed as a percentage of regional exports– represented differing proportions of total loans granted according to the period considered. Thus, while between 1975 and 1980 net long-term loans granted to the public sector represented 8.5% and those obtained in 1981 by the commercial banks accounted for 4.5%, these shares were 4% and more than 9%, respectively.

In the 1980s the direction of the international flow of financing changed abruptly, beginning with the diversion of funds to the United States. The posting of consecutive deficits in the biennium 1982-1983⁶ together with

a new monetary policy which brought about a significant increase in the interest rates offered, operated as a magnet attracting vast financial resources to a country that was widely perceived as solvent and whose currency had worldwide acceptance. Thus, from 1982 onward the United States market was transformed into a huge pole of attraction for financing. By and large, the industrialized countries recorded a significant increase in their fiscal deficits and in the negative balance on their current accounts (see table 2).

The payments difficulties of the highly indebted countries of Latin America in the early 1980s thus coincided with a radical change in international financial flows. This brought about the payments crisis for the countries of the region⁷ and the consequent reversal in the direction of the net transfer of financial resources. Up to 1982, this flow had been positive for Latin America, but from that year onward it became highly negative.

3. The net transfer of financial resources

a) *Definition*

Since the net transfer of resources, at current values, includes various components, it is important to identify its composition.

The global concept of net transfer of resources covers all transactions on the capital account of the balance of payments less the balance of factor services appearing on the current account. Consequently, it includes both those transactions recorded under the heading "errors and omissions (net)", which indicates movements not counted either in the current account (which correspond mainly to contraband, overbilling of exports and underbilling of imports) or in the capital account (which mostly correspond to inflows and outflows of private capital). In this analysis it is assumed that most of these movements corresponded to the second case.

Among the transactions recorded, a distinction should be drawn between the net transfer of credit and transfers in the form of foreign investment. The first consists of the net inflow of long-term capital (excluding investments) and short-term capital (official and from commercial banks) minus net interest payments. The other corresponds to direct and portfolio investments less payment of profits. Finally, the total of unrequited official transfers is counted separately.

b) *Postwar trends*

The flow of financial resources abroad was not significant in Latin America during the first three decades of the postwar period. During the first two decades, the total net transfer was slightly negative, equivalent on

average to one half of 1% of the regional product; by 1968 the net result had turned positive, following which it increased steadily, peaking at 3.2% of the product in 1978. After the second oil price shock and following the progressive increase in international interest rates, the net transfer of resources, which was still positive, declined steadily to 1% of the regional product. In 1982 the net flow of resources turned decidedly negative; during the period 1982-1988 the region transferred financial resources abroad equivalent to nearly four percentage points of the gross domestic product generated during that period, particularly in the years 1983 and 1985 during which net outflows of some 5% were recorded. This dramatic change in external financial flows reached the level of US\$300 billion, in constant 1987 dollars, since the US\$126 billion (in dollars of that year) received by the region between 1974 and 1981 declined to an outflow of US\$170 billion between 1982 and 1988, equivalent to almost 6% of the regional product (see table 3 and figure 3).

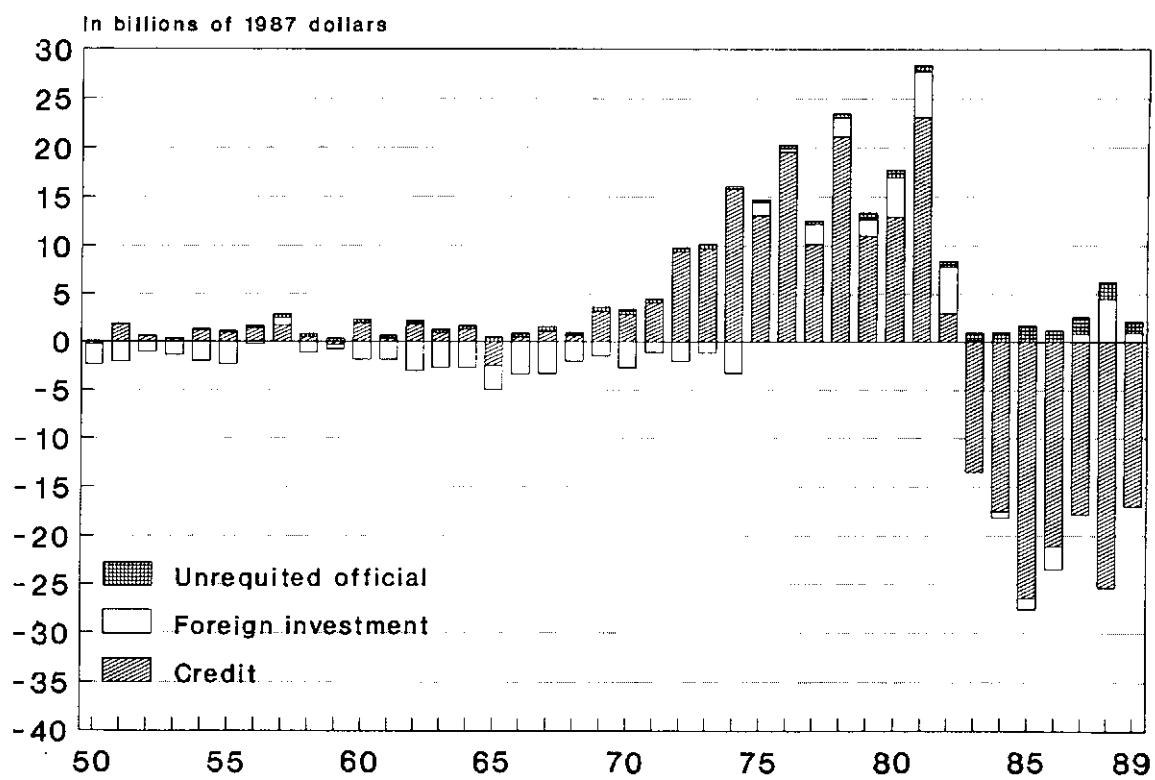

The limited but steady outflow of financial resources during the first decades of the postwar period reflected, almost exclusively, the deficit resulting from the remittances of profits abroad, which were higher than the inflow from direct and portfolio investments, a situation that was also aggravated by the flight of private short-term capital. Remittances of profits occurred mainly in the petroleum-exporting countries, in particular Venezuela, which set the pace for the region. In addition to the remittances by petroleum companies during those years, remittances were also made by agricultural and mining enterprises in Ecuador and Peru, as well as in Chile and Colombia.

In the early years of the 1970s, easy access to external credit modified the panorama described above and became the key factor in the region's external financing, both for petroleum-exporting and non-petroleum-exporting countries. Among the petroleum-exporting countries, the cases of Bolivia and Venezuela differ markedly from the others, since the large remittances of profits and the repatriation of capital exceeded the volume of credit received; the others, on the other hand, of which Mexico is the most significant, were recipients of resources.⁸

In the South American non-petroleum-exporting countries, the expanded credit flow was intensified by the inflow of private short-term capital, in a domestic context of favourable expectations.

The change in the international situation significantly increased the flow of net external credit between 1974 and 1981 and, once again, the resources obtained by Latin America through this channel (2.2% of GDP) constituted the basic nucleus of the external financing received. As in the previous three-year period, external inflows received by the petroleum-exporting countries exceeded the total of net resources obtained, since in some cases, the greater external indebtedness coincided with

Figure 3
LATIN AMERICA: RECORDED NET TRANSFER OF RESOURCES

considerable outflows of private short-term capital (Bolivia, Mexico), and in others, with large negative balances on net foreign investments (Ecuador and Venezuela). The first coincidence also occurred in some non-petroleum-exporting countries such as El Salvador, Nicaragua and, especially, Argentina, a country in which such outflows exceeded the value of net credits received during that period.

After 1982 the trend of external financing through credit came to a general halt and led to the so-called debt crisis, which was accompanied in many cases by considerable outflows of private capital. Indeed, the external payments crisis had already been anticipated by economic agents in the early 1980s; thus, during the three-year period 1980-1982, the region suffered a net outflow of unrecorded private capital of US\$27 billion, which was further increased by US\$22 billion in the form of smaller suppliers credits. Between 1982 and 1988, these net outflows of private capital represented on average 1.4% of the regional GDP.

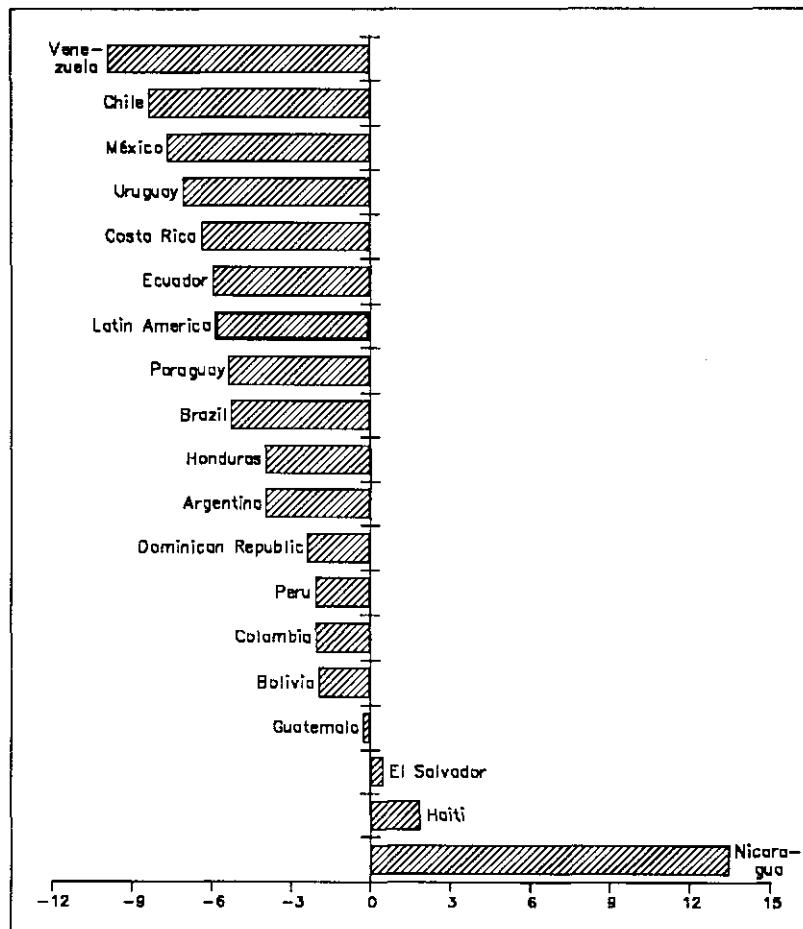

The magnitude of the problem of the transfer of resources abroad is revealed in all its tragic dimensions when compared to the foreign exchange requirements for meeting financial outlays from export earnings. The turnaround which took place in the relation between these two variables was extraordinarily sharp. Thus, while the region received resources equivalent to 21% of its exports during the second half of the 1970s (90% of which came in the form of loans), it received virtually no net inflows between 1980 and 1982 (since the massive capital flight was offset by fresh external indebtedness equivalent to more than 10% of exports), and after 1982 began to transfer resources abroad to a value of nearly 25% of its annual earnings from trade. In other words, if the period 1974-1981 is compared with that of 1982-1988, the negative transfer of resources abroad exceeded 40% of exports (see table 3).

The petroleum-exporting countries as a whole experienced a relatively sharper reversal, since from a net positive transfer of 2.2% of their gross domestic product they moved to a negative net transfer of 5.1%, equivalent to a change of more than 7% of the product, which reached its highest level (almost 10%) in Venezuela. Although most of this process was credit-related, the outflow of private capital constituted an additional severe drainage on resources between 1982 and 1988, which exceeded 2% of the product for the subgroup of petroleum-producing countries (see figure 4).

The reversal in the direction of total net transfers of resources was somewhat less marked in the non-petroleum-exporting countries of South America (5%); three fourths corresponded to credit inflows and almost all of the rest to the outflow of unrecorded private capital. Some of these countries also displayed special particularities. In Colombia the total transfer abroad recorded in most recent years was less than 1% of the product as against an average of 3% for this group and of almost 4% for the region as a whole.

Figure 4

LATIN AMERICA: REVERSAL OF NET TRANSFER OF RESOURCES a/
(Coefficients as a percentage of GDP)

Source: ECLAC, based on official data.

a/ Corresponds to the difference between the average for 1982-1988 and the average for 1974-1981.

Paraguay for its part, experienced a similar trend to that of the Central American subregion, since it maintained a net inflow of resources during the last 40 years, receiving during the period 1982-1988 an amount equivalent to 2% of the product. For its part, Chile and Uruguay continued the general trend of the South American group of petroleum-exporting countries, although a number of significant factors should be highlighted. Indeed, Uruguay recorded heavy outflows of private capital representing almost 3% of its product during the period 1982-1988, following the positive balance resulting from direct investments from Argentina, mainly in real estate. In Chile, during the same period, of particular importance was the net inflow of foreign investment equivalent to over 1% of the product, while the regional average was nil and net credit transfers abroad in relation to the product were the highest in Latin America, with an outflow equivalent to more than 4% of the product.

The Central American countries, on the other hand, continued to receive financial resources from abroad during the period under review, although through different channels. Thus, after recording a positive transfer of over 4% of the product between 1974 and 1981 (almost entirely in the form of financial loans), during the crisis net transfers continued to be positive accounting for almost 4% of the product, although more than half corresponded to unrequited official transfers. Of particular significance was the credit granted to Nicaragua in the last 15 years, which represented 9% of that country's product during the period 1974-1981 and almost 18% between 1982 and 1988.

Credit transfers, which had been severely limited during the first two decades of the postwar period, constituted the main component of external financing in Latin America in the last two decades. During the 1950s and 1960s and in the early years of the 1970s, the contribution of such transfers did not even represent 1% of the total product. After 1973 net external credit increased markedly, pushing this coefficient up to approximately 3% of the product in 1976 and 1978. From 1982 onward, however, net inflows by way of credits fell drastically and even turned negative, with transfers abroad peaking at 4% of the product in 1985. External credit transfers, which had brought in financing equivalent to 17% of exports during the period 1974-1981, thus led to an outflow of foreign exchange equivalent to 16% of exports in the period 1982-1988; in other words, there was a decline of almost 5% in the product and a contraction of import capacity of nearly one third of the value of exports. The reversal of financial flows could have been even greater since in the latter period there were significant arrears in debt-servicing payments, which meant in practice, additional, albeit involuntary, financing.

This sharp reversal was due both to the contraction of external financing –net loans received, which had amounted to 48% of regional exports in

1981, accounted for only 2% in 1988-, and to the simultaneous increase in the payment of interest on the debt. Thus, during the period 1982-1988 the region was forced to devote an amount equivalent to four and a half percent of its product (almost one third of the value of its exports) to the payment of interest on loans received, as against inflows of net credit of just over 2% of the product, while between 1974 and 1981 outflows of foreign exchange by way of interest represented 1.5% and the net inflow of capital almost 4% (see table 4).

One of the most significant developments related to the reversal of external financial flows was that in many cases the State assumed a large part of the private debt. The mechanisms employed were varied; one of them, which was frequently used in some countries, consisted in converting the private sector domestic debt owed the commercial banks into public sector external debt through the acquisition, generally by the Central Bank, of portfolios with high proportions of loans that were difficult to collect. The basic objective of this conversion was to shore up the domestic financial system which was in danger of collapse.

The flow of foreign exchange in the form of *net foreign investment* did not represent for the region as a whole a significant inflow of external financing. Indeed the balance of such flows was negative by almost 1% of the product up to the first half of the 1970s due to the fact that remittances of profits systematically exceeded the volumes of fresh investments. The outflow of foreign exchange under this head was alleviated during the first half of the 1970s, and the trend turned slightly positive in the succeeding years due to the relatively smaller remittances of profits; the latter, which had constituted 1.4% of the product in the 1950s, fell to 0.6% in the 1980s.

The limited impact of this flow was due to specific trends, both on the part of investment enterprises and of the receiving countries. Generally speaking, direct foreign investment was not promoted by the countries of the region, while potential investors evaluated their projects using high risk coefficients.⁹ Overall, direct and portfolio investments in gross terms (that is to say, without discounting outflows by way of remittances of profits) peaked in 1981 at US\$10 billion, equivalent to 9% of exports.

Between 1950 and 1970, the unfavourable net flow of foreign investment to Latin America was determined by Venezuela; remittances of profits from that country during those years were on such a scale that almost the entire outflow from the region could be attributed to that source. Remittances abroad were also considerable in Mexico and Peru, among the petroleum-exporting countries, and in Argentina, Brazil and Chile, among the non-petroleum-exporting countries of South America, although in the latter cases there were simultaneous inflows of investment resources, which reduced and even totally offset the negative effect of those remittances (see table 5).

In the early 1970s, Venezuela consistently posted a sizeable negative balance and determined the direction of regional transfers abroad derived from net foreign investment. At the same time, however, Brazil began to assume the position of main recipient of foreign investment, followed by Mexico; between 1970 and 1973 these two countries received more than 85% of direct and portfolio investment made in the region, which signalled a marked increase in investment by transnational industrial enterprises, mainly from the United States, to the countries of Latin America with high-potential domestic markets.

Between 1974 and 1981 foreign direct and portfolio investment doubled in constant dollars; Brazil, Mexico and Argentina absorbed more than 80% of the total investment in the region. During this period gross income from foreign investment exceeded remittances of profits, resulting in a net balance that was slightly in surplus in relation to the regional product. The crisis of the 1980s also affected the flow of foreign investment, which declined in most of the countries, with a few exceptions, most notably Argentina, Colombia and Chile. In the latter cases direct and portfolio foreign investment rose to their highest levels, measured in constant dollars, of the last 40 years.

Finally, the value of *unrequited official transfers* was significantly high in some countries of the region. In a context of selective unrequited assistance, inflows were directed to Central America, Bolivia and Peru. The total amount of unrequited official transfers to the region was US\$500 million in 1987 dollars in the 1970s and rose significantly in the following decade (see table 6). While the amounts transferred were not very significant for the region as a whole, they constituted a significant inflow from abroad in the case of Central America, which received more than half the regional total. From the late 1970s onwards, external inflows to this group of countries increased to 1% of the product and continued to rise until by the late 1980s they accounted for almost 4% (2.5% of the gross domestic product as an average for the period 1982-1988). For Latin America as a whole, however, unrequited transfers received remained steady at about 0.1% of the regional product during the last 40 years (see table 3).

4. Restrictions on future growth

The high external indebtedness and the heavy burden of the debt service were to a large extent responsible, as demonstrated on many occasions,¹⁰ for the poor performance of the Latin American and Caribbean economies during the 1980s, as well as for the persistence of the crisis that has affected the region in the present decade.

Moreover, the debt overhang and the negative transfer of resources abroad constitute severe restrictions on the region's real possibilities for growth over the next few years. In order to illustrate the magnitude of these

obstacles, simulation exercises have been prepared, which permit comparisons to be made between the consequences for economic growth and the external payments situation that would flow from the persistence of the debt overhang, or from recourse to the different proposals for tackling the external debt problem.¹¹ A summary follows of the results of the basic scenario, which assumes the persistence, without change, of the current situation of indebtedness; in other words, a scenario in which there is no reduction whatsoever in the debt or its servicing, in which the volume of commercial bank loans continues to be low, and in which loans from official sources, both bilateral and multilateral, continue to be governed by current criteria of credit "rationing". Only variables related to international interest rates and to the possibility of achieving increased exports of non-traditional products have been taken into account.¹²

Under such a scenario, the net transfer abroad of resources from the region would be higher than that effected during the period 1987-1989, representing 3.8% of the product. In the case of the Central American and Caribbean countries, the current positive transfer would be significantly reduced, and in the case of the English-speaking Caribbean countries, it would be transformed into a large negative balance (see table 8).

A dominant factor in this negative transfer would be the level of interest owed, which could represent as much as 4% of the product, in the case of the large countries, almost 5% in the case of medium-sized countries, and –most seriously– between 5% and 8% in the two groups of small countries (see table 9).

In order to be able to effect a transfer of resources on this scale, the region would need to achieve an even larger surplus on its trade balance than it has over the past few years. Thus, the average trade balance, which during the period 1987-1989 represented an amount equivalent to almost 19% of exports and on which the massive transfer of resources during that period was based, should increase on average to a volume equivalent to almost 22% of exports in the period 1990-1995. Only the large countries, which have already accumulated considerable trade surpluses, would be in a position to effect such transfers of resources without expanding the relative size of their surpluses; the non-petroleum-exporting medium- and small-sized South American countries would be required to obtain much higher relative positive balances than those achieved in the recent past, while the Central American and Caribbean countries would experience significant reductions in their current trade deficits (see table 10).

Inherent in this scenario is the accentuation of the processes of adjustment as a mechanism to permit the generation of a trade surplus large enough to fully meet debt servicing requirements. In view of the necessary restriction on imports,¹³ the results in terms of growth would be very limited; the region as a whole may achieve an average growth rate of just

over 2%, while the relatively smaller countries may grow at rates of under 2% or less than 1% (see table 7). In any event, such rates assume a decline in per capita product during the six year period 1990-1995.

Shrinking economic activity and the outflow of resources would keep the investment coefficient down to relatively low levels; in the basic scenario, these levels could even decline relative to the average rates recorded in the period 1987-1989, with the exception of the group of large countries (see table 11).

- In this scenario, per capita consumption would probably decrease. For the region as a whole it would fall at an annual rate which would situate it, in 1995, at a level 3% lower than the 1989 level. Only in the case of the medium-sized countries, would per capita consumption in that year be somewhat higher (2%) than the 1989 level, even though that would not mean a return to the pre-crisis levels. It is also likely that in the other groups of countries accumulative declines could take place which may be—in the case of Central America and the Caribbean—up to 18% (see table 7).

As is well known, in a considerable number of countries, the strategy to meet debt servicing commitments within a framework of financial restrictions, far from eliminating the problem of the debt overhang, usually leads to a small increase in the balance of the debt (see table 12). However, in this scenario the coefficients of indebtedness could exhibit a different trend, according to the group of countries being considered. For the region as a whole, the debt/product ratio would fall slightly (from 50% to 48%), while the rise in imports would reduce the debt/exports coefficient from 314% to 237%. This reduction would be concentrated, however, in the group of large countries; in the small South American and Caribbean countries, the ratio between the external debt and the product would rise considerably, which would cancel out the apparent relief brought about by the reduction in the debt/export ratio (see table 13).

- A simulation was also prepared of a variant of the basic scenario, which assumed the maintenance of international interest rates at their 1989 levels instead of a reduction of 1.2 points in the LIBOR rate throughout the period 1991-1992.¹⁴ The greater volume of resources that would be required for debt servicing would negatively influence growth potential in the economies of the region. Taken together, growth in these economies would fall from 2.1% per annum (basic scenario) to 1.2%, while per capita consumption would decline even further than under the basic scenario. In turn, the net transfer of financial resources would rise from 3.8% to 4.6% of the gross domestic product.

Another of the simulated variants of the basic scenario consisted of the doubling of the growth rate for non-traditional exports, representing additional income of US\$40 billion during the period 1990-1995. This greater financial inflow would permit a substantial increase in imports,

investment and the product. Thus, the growth rate of the product could rise to 2.9% per annum while per capita consumption could increase slightly instead of decrease. Transfers, on the other hand, would barely decline, since most resources obtained from abroad would be allocated to imports (see table 7).

As an alternative scenario to these variants of the basic scenario which assumed the contraction of external financing, a simulation was done of the scale of external financing that would be required in each group of countries to permit 5% annual growth in the product during the period 1991-1995, and consequently, for a nearly 3% increase per annum in the per capita product of the region. In that case, the positive balance on the trade account of the region would practically disappear (declining to 1.5% of exports) thereby reducing to nil the net transfer of resources. An inflow of US\$335 billion in fresh loans would thus be required for the period 1990-1995 (instead of US\$103 billion in the basic scenario), which would result in an increase in the external debt in 1995 of 13% of the gross domestic product in comparison with the basic scenario (see table 12).

It was also assumed that unrequited transfers would remain steady in keeping with the trend of recent years. For the small countries such transfers have been significant. It was also projected that countries would proceed with the necessary adjustments to avoid disequilibriums in their balance of payments, as well as arrears in payments on their debt service commitments.

With regard to the domestic functioning of the economies, account was taken of the fact that restrictions on domestic supply and the deteriorated situation of many sectors would significantly affect demand for imports, which is closely linked to growth in the product as a whole and in investment in particular. In recent years, even in the face of extremely high exchange rates, imports have risen notably at the least sign of economic recovery. Consequently, although a substantial initial increase in imports has been projected, in the subsequent years this level would return to the more long-term historical pattern. For their part, estimates of investment levels had been conditioned upon the growth rate which was in turn based on the historical experience of the incremental ratio between capital and the product. Finally, international reserves are not expected to undergo any major variations since the countries of the region would be unable to reduce the level of such reserves to any significant degree nor would they be able to accumulate any significant reserves even in those countries with large trade surpluses.

* The concepts of transfer utilized are as follows: (1) Total: equivalent to the net inflow of capital less net payments of profits and interest. (2) Recorded: equivalent to the net inflow of capital (not including errors and omissions (net) and short-term capital from other sectors) minus net payment of profits and interest. (3) Credit: equivalent to the net inflow of long-term capital (not including investment) and the inflow of short-term capital (official and from commercial banks) less net payments of interest. (4) Foreign investment: equivalent to direct and portfolio investment less net payment of profits. (5) Unrecorded: equivalent to errors and omissions (net) plus short-term capital from other sectors. ^b The coefficients were obtained on the basis of figures in current dollars. The amounts of transfer were converted to 1987 dollars using the United States wholesale price index. ^c 1962-1987. ^d 1955-1959.

*The concepts of transfer utilized are as follows: (1) Net credit: equivalent to net long-term capital inflow (not including investment) and short-term capital inflows from official and commercial bank sources (thereby excluding capital from other sectors) minus net interest payments. (2) Net foreign investment: equivalent to direct and portfolio investment, minus payment of profits. (3) Total recorded: equivalent to net credit transfers plus foreign investment plus unrequited official transfers.

^b Calculations based on figures in current dollars.

Source: ECLAC, Endeudamiento externo y crecimiento económico en América Latina y el Caribe: Consecuencias económicas de la propuesta de reducción de la carga de la deuda formulada por la Secretaría Permanente de SELA, comparadas con las de escenarios alternativos (I.C.R. 841), Santiago, Chile, 29 December 1989.

Basic scenario: Interest rate declines by 1.2 points in relation to 1989.

Scenario E: Growth rate of non-traditional exports doubles.

Scenario I: Interest rates remain at their 1989 level.

Scenario C: Growth of GDP is 5% in all countries.

Large countries: Argentina, Brazil and Mexico.

Medium-sized countries: Colombia, Chile, Peru and Venezuela.

Small South American countries: Bolivia, Ecuador, Paraguay and Uruguay.

Central American and Caribbean countries: Costa Rica, El Salvador, Guatemala, Honduras, Haiti and Dominican Republic.

English-speaking Caribbean: Barbados, Guyana, Jamaica and Trinidad and Tobago.

Notes

¹The flow of profit also poses the problem of the domestic generation of resources and their transfer. In the case of direct investments, these yield their own profits in national currency and contribute, in turn, to the generation of the foreign exchange required for transfers to the extent that their additional production is exported or displaces imports in total expenditure. This is also true of loans that have been soundly invested. The problem of transfers abroad disappears when such transfers are covered by the balance-of-payments position. The problem of the domestic transfer of resources or "liquidity" arises where the debtor entity (public or private) has not invested the loan productively, or where (the State) it has invested it in infrastructure which generates external economies –from which it does not receive the benefit– or, finally, where (the State) has assumed the debt of insolvent enterprises. In all of these cases (in the first as lender of last resort) the State must rely on mechanisms that permit it to domestically attract the deposits needed to acquire the foreign exchange generated by the exporters, the failure of which effort would necessitate recourse to inflationary financing in order to meet external transfer requirements, which if not met, would then result in slipping into arrears.

²Import capacity in real terms is defined as the algebraic sum of exports, the payment of factors abroad and the flow of capital, each of which is deflated by the prices of imports, with the twin objective of achieving intertemporal comparability and measuring needs in terms of external purchases.

$$(1) \text{ IC} = \frac{X}{Ip} - \frac{\text{FPA}}{Ip} + \frac{\text{BCA}}{Ip}$$

where IC import capacity; X exports in current dollars; FPA factor payments abroad; BCA balance on capital account; Ip import prices.

$$(2) \text{ PPE} = \frac{X}{Ip} \quad \text{and} \quad (3) \text{ NTRA} = \frac{\text{BCA}}{Ip} - \frac{\text{FPA}}{Ip} + \text{TTE} = \text{IC} - \text{XCP}$$

where PPE purchasing power of exports; NTRA net transfer of resources abroad; TTE terms of trade effect and XCP exports at constant prices.

³The rise in the international price of petroleum in the 1970s led, moreover, to a contraction of demand and, consequently, to a drop in the volume exported.

⁴For an analysis of the systemic origins of the debt of Latin America and the Caribbean see ECLAC, *Latin America and the Caribbean: options to reduce the debt burden* (LC/G.1605-P), Santiago, Chile, March 1990.

⁵The value of world trade increased at a similar rate during this period.

⁶The fiscal deficit went from 2.7% of the product in 1981 to 4.1% and 6.2% in the next two years and to an average of 5% between 1984 and 1986, while the external current account which was in surplus by just under US\$7 billion in 1981 turned negative by almost US\$9 billion in 1982, by more than US\$46 billion in 1983 and more than trebled that deficit between 1983 and 1987. (See *International Financial Statistics*, International Monetary Fund, various issues.)

⁷For a detailed analysis of the causes of the crisis, see ECLAC, *Políticas de ajuste y renegociación de la deuda externa de América Latina* (LC/G.1332), Cuadernos de la CEPAL series, No. 48, Santiago, Chile, 1984, United Nations publication, Sales No. S.84.II.G.18, and the case studies of selected countries in Miguel Wionczek (ed.), *La crisis de la deuda externa en América Latina*, vol. 2, Mexico City, Fondo de Cultura Económica, 1987.

⁸In the case of Ecuador, positive transfers accounted for almost 4% of the product during that period, thanks to foreign investment in the exploitation of its hydrocarbons.

⁹Foreign investment trends were influenced both by the strategy of transnational enterprises and by the domestic legislation of each country.

¹⁰See, for example, ECLAC, *Latin American and Caribbean Development: Obstacles requirements and options* (LC/G.1440-P), Cuadernos de la CEPAL series, No. 55, Santiago, Chile, June 1987. United Nations publication, Sales No. S.87.II.G.9, especially pages 17-19; ECLAC, *Towards sustained development in Latin America and the Caribbean: restrictions and requisites* (LC/G.1540-P),

Cuadernos de la CEPAL series, No. 61, Santiago, Chile, January 1989. United Nations publication, Sales No. S.89.II.G.3, especially pages 17-24; and *Preliminary overview of the economy of Latin America and the Caribbean* presented in December of each year, several issues, particularly the last section.

¹¹See ECLAC, *Endeudamiento externo y crecimiento en América Latina y el Caribe: consecuencias económicas de la propuesta de reducción de la carga de la deuda formulada por la Secretaría Permanente del SELA, comparadas con las de escenarios alternativos* (LC/R.841), Santiago, Chile, December 1989.

¹²The methodological annex contains the assumptions used, for each variable, in the simulation of the basic scenario.

¹³Despite the increase in exports and the relative steadiness of the terms of trade, which are assumed in this basic scenario, a limitation of imports would be required in most cases to permit the full servicing of the debt, since the possibilities of increased net substitution of imports have been largely exhausted.

¹⁴This new assumption coincides with that used by the IMF in *World Economic Outlook*, May 1990, in which this organization modifies its estimate of April 1989, which had forecast a drop in international interest rates.

METHODOLOGICAL ANNEX

Assumptions used for the simulation of the basic scenario¹

In preparing the simulation of the base scenario it was necessary to adopt a set of hypotheses related to external and domestic economic conditions. It was assumed, for example, that the annual growth rate of the economies of the Organization for Economic Co-operation and Development (OECD) countries would be between 2% and 3%, while the volume of international trade would increase by an annual 6%.² For its part, the volume of exports from the region would increase by between 2.8% and 4.6%, according to the countries. This expansion should follow from the incorporation of new products, since in most cases the possibility of boosting traditional exports is very limited in view of the low investment level of recent years. Import and export prices, meanwhile, would rise by between 3% and 4%, with the exception of hydrocarbons, the price of which it was assumed would remain constant.

With respect to the evolution of international interest rates, the estimate prepared in 1989 by the IMF³ was used. This estimate assumes the gradual decrease of the LIBOR rate during 1990 and 1991 up to 1.2 percentage points below the corresponding value for that year. It was also assumed that official loans would continue to be granted at concessional rates.

With respect to capital movements, it was established that the inflow of new loans would come basically from official sources and that gross disbursements would be somewhat more than US\$15 billion per annum between 1990 and 1995 for the region as a whole. In the case of the commercial banks, on the other hand, there would be a modest amount of new money, some US\$2 billion per year. Amortization payments, for their part, would only be made on official loans and would total US\$11.5 billion annually, while capital payments due commercial banks would be rescheduled. The volume of foreign investment would remain at the highest levels recorded in recent years, that is to say, between US\$6 billion and US\$7 billion per year. It was also assumed that unrequited transfers would maintain their traditional levels in keeping with the trend of recent years, such transfers being significant in small countries. It was also concluded

that countries would undertake the adjustments necessary to avoid disequilibriums in their balance of payments and arrears in their debt servicing payments.

With respect to the functioning of the economies at the domestic level, account was taken of the fact that the restrictions on the domestic supply and the deteriorated situation of many sectors, would significantly affect demand for imports, which is closely linked to the growth of the product in general and to investment in particular. In recent years, notwithstanding extremely high exchange rates, the level of imports has picked up significantly at the least sign of economic recovery. Consequently, although a very high initial increase in imports has been projected, the succeeding years should see a return to more long-term historical patterns. Investment, for its part, has been estimated in relation to the growth rate based on the historical experience of the incremental capital/product ratio. Finally, international reserves are not expected to record significant variations, since the countries of the region would not be able to significantly reduce the level of such reserves nor to increase it noticeably, even in those countries with large trade surpluses.

Notes

¹See ECLAC, *Endeudamiento externo y crecimiento...*, op. cit.

²These hypotheses were selected on the basis of the better known projections, such as those of the World Bank, the IMF, Wharton Econometric Forecasting Associates, the European Community and the OECD.

³See International Monetary Fund, *World Economic Outlook*, Washington, D.C., April 1989.

Source: ECLAC, on the basis of figures provided by the International Monetary Fund.

¹The categories used here are defined as follows:

(1) Total: Net capital income (excluding net payments of profits and interest).

(2) Recorded: Net capital income (excluding net errors and omissions and other short-term capital) minus net payments of profits and interest.

(3) Credit: Net long-term capital income (except investments) and short-term capital income (official and commercial banks) minus net payments of interest.

(4) Foreign investment: Direct and portfolio investment minus net payment of profits.

(5) Unrecorded: Net errors and omissions plus other short-term capital.

ECONOMIC COMMISSION FOR LATIN AMERICA AND THE CARIBBEAN
Casilla 179-D Santiago, Chile

PERIODIC PUBLICATIONS

CEPAL Review

CEPAL Review first appeared in 1976 as part of the Publications Programme of the Economic Commission for Latin America and the Caribbean, its aim being to make a contribution to the study of the economic and social development problems of the region. The views expressed in signed articles, including those by Secretariat staff members, are those of the authors and therefore do not necessarily reflect the point of view of the Organization.

CEPAL Review is published in Spanish and English versions three times a year.

Annual subscription costs for 1992 are US\$16 for the Spanish version and US\$18 for the English version. The price of single issues is US\$10 in both cases.

The cost of a two-year subscription (1992-1993) is US\$30 for Spanish-language version and US\$34 for English.
