Paraguay: connectivity indicators and social development

Mical Rodríguez Laconich
This document was prepared by Mical Rodríguez Laconich, consultant of the Infrastructure and Logistics Unit of the International Trade and Integration Division of the Economic Commission for Latin America and the Caribbean (ECLAC), under the supervision of Miryam Saade Hazin, Officer-in-charge of the Unit, as part of the activities of the United Nations Development Account (UNDA) project, “Sustainable transport connectivity and implementation of transport-related SDGs in selected landlocked and transit/bridging countries”.

Representatives from the following institutions of Paraguay provided information and suggestions during preparation of the report: the Directorate-General for the Merchant Navy (DGMM), the Ministry of Foreign Affairs, the Ministry of Industry and Trade, the Ministry of Public Works and Communications, the Ministry of the Environment and Sustainable Development, the National Agency for Transit and Road Safety (ANTSV), the National Authority for Shipping and Ports (ANNP), the National Customs Department (DNA), the National Institute for Food and Nutrition (INAN), the National Service for Plant and Seed Quality and Health (SENAVE) and the National Transport Department (DINATRAN). Information and suggestions were also received from TERPORT (Terminales Portuarios S.A.).

The United Nations and the countries it represents assume no responsibility for the content of links to external sites in this publication.

Mention of any firm names and commercial products or services does not imply endorsement by the United Nations or the countries it represents.

The views expressed in this document, which has been reproduced without formal editing, are those of the authors and do not necessarily reflect the views of the Organization or the countries it represents.

The boundaries and names shown on this map do not imply official endorsement or acceptance by the United Nations.

Abstract

This report updates as necessary the indicators of Paraguay’s National Connectivity Report (NCR) developed in 2020 and includes a section concerning social development considerations that were outside the scope of the NCR and its Sustainable Inland Transport Connectivity Indicators (SITCIN).

The National Connectivity Report is managed by the United Nations Economic Commission for Europe (UNECE) in collaboration with the United Nations Economic Commission for Latin America and the Caribbean (ECLAC) and the United Nations Economic and Social Commission for West Asia (ESCWA) and was developed under United Nations Development Account (UNDA) funded “Sustainable transport connectivity and implementation of transport-related Sustainable Development Goals (SDGs) in selected landlocked and transit/bridging countries” project. The NCR report covers and measures the performance of inland transport modes: railway, road, and inland waterway (ILW) transport modes. In Paraguay’s NCR, railway transport indicators are not covered because railways are not used for cargo transport. All modes of transport are studied through three key pillars: economic, social, and environmental sustainability.

Five (5) pilot countries were selected from different regions of the world to measure inland transport connectivity, compare each country’s performance, and evaluate connectivity progress in the next years. Paraguay is one of the pilot countries where the Sustainable Inland Transport Connectivity Indicators (SITCIN) will be tested and, based on the results, the indicators will be further fine-tuned. The NCR preparation process is generally divided into the following key phases: (1) data-collection and meta-analysis, (2) relevant fact-finding missions and interviews with the stakeholders, (3) analysis of findings and drafting of recommendations, and (4) discussion of NCR results in national policy dialogue meetings with the stakeholders.

Fact-finding missions were held by the project team to review the beneficiary country’s transport system information and statistics and gather views and approaches from competent national authorities and relevant stakeholders. In the frame of the fact-finding missions, the SITCIN team met with representatives of various public institutions and visited the Border Crossing Points at Jose Falcón and Ciudad del Este.
The following private and public stakeholders from Paraguay were consulted during the SITCIN data collection process, that took place from February to December 2020: Ministry of Public Works and Communications (MOPC), Ministry of Foreign Affairs (MRE), National Transport Authority (DINATRAN), National Authority for Navigation and Ports (ANP), TERPORT, Merchant Navy Administration (DGMM), Ministry of Industry and Trade (MIC), Ministry of Sustainable Development and Environment (MADES), National Customs Authority (DNA), National Agency for Road Safety (ANTSV), National Institute for Food and Nutrition (INAN), National Service for Plant and Seed Quality and Health (SENAVE).

In total, SITCIN includes 215 different indicators, but in the Paraguayan case, data was collected to evaluate 161 indicators for road and Inland Waterway transport (54 railway indicators were excluded from Paraguay’s NCR because the railway transport mode in the country is not used to transport goods).

SITCIN scoring results are divided into 6 chapters:

(i) Border Crossing Facilitation
(ii) Transport Infrastructure
(iii) Safety and Security
(iv) Transport of perishable foodstuffs and dangerous goods
(v) Intermodality
(vi) Environment

Conclusions and recommendations are developed and summarized based on detailed analysis of data collected through surveys, interviews, consultations, desktop research, etc., as well as findings and statements defined in the SWOT analysis (Strengths, Weaknesses, Opportunities, Threats).

Recommendations are also divided into the six chapters mentioned above. In each chapter, recommendations are addressed to the following segments: Government and its agencies, International Organizations, Transport business – private companies, and relevant associations.
Introduction

The Sustainable Inland Transport Connectivity Indicators (SITCIN) methodology is a tool developed under the UNDA-funded project “Sustainable Transport Connectivity and Implementation of Transport-related Sustainable Development Goals (SDGs) in selected landlocked and transit/bridging countries”. This project is managed by the United Nations Economic Commission for Europe (UNECE) in collaboration with the United Nations Economic Commission for Latin America and the Caribbean (ECLAC) and the United Nations Economic and Social Commission for West Asia (ESCWA).

The SITCIN aims to allow the countries to report on the progress they are making towards achieving the UN SDGs, the 2030 Agenda for Sustainable Development, and ultimately the Vienna Programme of Action (VPoA). Countries and their external partner organizations of the project will be able to base their assessment of the effectiveness and efficiency of the transport systems and the level of compliance of national administrative and legal frameworks with UN legal instruments in the field of transport and border crossing facilitation, providing a domestic and a cross-border perspective and improving competitiveness, safety, energy efficiency and security in the transport sector. Furthermore, the countries will be able to measure the effectiveness of their efforts in implementing UN legal instruments in the field of transport and work towards the harmonization and standardization of rules and documentation, including through more effective implementation of international conventions on transport and transit and regional/bilateral agreements.

This National Connectivity Report (NCR) is the next step after the development of SITCIN. Paraguay is one of the five case-study countries where the SITCIN will be tested and based on the results, will be further fine-tuned. This report updates as necessary the indicators of Paraguay’s National Connectivity Report (NCR) developed in 2020 and includes a new section concerning social development considerations that were outside the scope of the NCR and its Sustainable Inland Transport Connectivity Indicators (SITCIN).

A. NCR concept and phases

The NCR report covers and measures the performance of inland transport modes: namely railway, road, and inland waterway (IWW) transport modes. In the Paraguayan case, railway transport was not developed during the NCR preparation period. All modes of transport are studied through three key pillars: economic, social, and environmental sustainability.

The NCR preparation process is generally divided into 4 key phases: (i) data collection, (ii) fact-finding missions and interviews with the stakeholders, (iii) analysis of findings, drafting of recommendations, (iv) discussion of NCR results on a national policy dialogue meeting with the stakeholders.

Capacity-building workshops were held targeting the most pressing topics of inland transport policy, based on the NCR recommendations and findings.

B. Fact-finding mission in Paraguay

The fact-finding missions were held by the project team to review the beneficiary country’s transport system information and to gather views from competent national authorities and relevant stakeholders.

During the fact-finding missions, the SITCIN team visited:

- Border crossing point (BCP) Jose Falcón on February 12th, 2020
- BCP Ciudad del Este on February 13th, 2020

The purpose of the initial fact-finding missions was to conduct extensive consultations with national stakeholders, collect relevant data and information (on hardware/software, policies, and regulations), and identify connectivity gaps and challenges.

C. National Stakeholders

Various institutions from the private and public sectors in Paraguay were consulted during the SITCIN data collection process that took place from February to December 2020:

- Ministry of Public Works and Communications (MOPC)
- Ministry of Foreign Affairs (MRE)
- National Transport Authority (DINATRAN)
- Ministry of Industry and Trade (MIC)
- National Agency for Road Safety, (ANTSV)
- National Authority for Navigation and Ports (ANNP)
- Port Terminal (TERPORT)
- Merchant Navy Administration (DGMM)
- Ministry of Sustainable Development and Environment (MADES)
- National Customs Authority (DNA)
- National Institute for Food and Nutrition (INAN)
- National Service for Plant and Seed Quality and Health (SENAVE)
D. Project aim

The overall aim was to: (i) evaluate both the institutional and legal set-up as well as the regulatory and administrative environment related to border crossings, (ii) customs and transit procedures, (iii) appraise the quality of the administrative framework (including consignment and transport documentation regimes) surrounding road and rail transport respectively, (iv) analyze the quality and effectiveness of transport and logistics infrastructure, (v) determine the robustness of the road traffic management and road traffic infrastructure system, (vi) assess the quality of the regulatory framework surrounding the transport of dangerous goods and perishable foodstuffs and (vii) evaluate efforts aimed at reduction of greenhouse gases, age and maintenance of vehicle fleet and air and noise emissions.

The aim of the project is that the SITCIN will be used by LLDCs and non-LLDCs, both inside and outside the UNECE region, to voluntarily assess and report their international transport connectivity. With assessments on an annual basis, benchmarking and time-series data could be developed.
I. Sustainable Inland Transport Connectivity Indicators (SITCIN) Methodology

SITCIN indicators and sub-indicators are classified according to the following three modes of transport: roads, railways, and inland waterways. Moreover, to comply with the United Nations Sustainable Development Goals, the indicators are further divided into the three pillars of sustainable development: Economic, Social, and Environmental sustainability. The indicators are structured to respond and to improve the key targets of each pillar: “enhancing efficient movement”, “enhancing safety and security”, and “creating environmentally sustainable transport systems”.

Diagram 1
Pillars of sustainable development, marking, and numbering of SITCIN indicators

Source: SITCIN methodology document.
Pillar 1: Economic Sustainability —refers to practices that support long-term economic growth without negatively impacting other aspects of development. The key target for this dimension is "Enhancing efficient movement". Pillar 2: Social Sustainability —refers to sustainable traffic and transport systems with lower social costs, such as fewer accidents and fewer traffic delays. The key target for this dimension is "Enhancing safety and security". Pillar 3: Environmental Sustainability —refers to the reduction of greenhouse gas emissions, air pollutants, and noise emissions. The key target for this dimension is "Creating an environmentally sustainable transport system".

Source: SITCIN methodology document.

There are 39 indicators in total, and each of these 39 indicators contains several sub-indicators. The total number of sub-indicators is 215, out of these 121 are dedicated to road transport and logistics, 54 are related to railway transport and 40 to IWW Transport. An overview of the structure and number of all indicators and sub-indicators is shown in Table 2.

The indicators are scored in descending order on a scale of 0 to 10. On this scale, level 0 is assigned for the worst scenario, for instance when a specific regulation does not exist. Level 10 represents an ideal scenario. In some cases, a score less than 10 is given for the best scenario in place. In this case, additional points are available when for instance an additional measure is implemented to achieve the promoted objective.
II. Data collection process

The SITCIN team briefed the national stakeholders on the benefits of the project “Sustainable Transport Connectivity and Implementation of transport-related Sustainable Development Goals (SDGs)” and discussed the Sustainable Inland Transport Connectivity Indicators draft.

Based on the SITCIN, a detailed questionnaire for each stakeholder was prepared. Some questionnaires were translated into Spanish to simplify the data collection process. The SITCIN national consultant identified, evaluated, and analyzed data gathered from public agencies and private companies.

Several interviews were held with representatives from public and private stakeholder agencies and organizations to gather relevant information and data:

- Joint introductory meeting with public agencies
- Joint introductory meeting with private companies
- Site visits to 2 different road BCPs
- Case-based B2B meetings with specialists and experts

The difficulties identified during the data collection process were related either to a lack of data or an absence of consolidated data. In some cases, data is available but scattered among different organizations. Moreover, misunderstandings regarding the definitions of indicators and the scoring system were another reason for additional questions and detailed discussions with stakeholder agencies.

The data that are used to compile SITCIN can be categorized as follows:

- Quantitative data, which is subdivided by:
  - Discrete data, such as the number of accidents and the number of vehicles that are usually expressed in absolute terms or as ratios.
  - Continuous data, which is used to measure the length of infrastructure (in kilometers), the goods transported (in tons) or the waiting time at borders (in minutes).
- Qualitative data: In most cases, qualitative data—such as infrastructure conditions—is used to categorize performance from "very good" to "very poor", producing an ordinal scale where the higher the value the better the performance.
III. Country information

A. Key economic indicators of Paraguay

- GDP per capita PPP (current international USD): 13,210.3.
- Population (million inhabitants): 7.0.
- Surface Area (sq. km): 406,752.
- Human Development Index: 0.710 female / 0.734 male.
- Trade (exports and imports as a percentage of GDP): 69.8.

B. Paraguay’s road transport infrastructure

The Ministry of Public Works and Communications (MOPC) of Paraguay is in charge of proposing and executing the policies and provisions regarding infrastructure and basic services for the integration and economic development of the country. The road system in the country is classified in three groups: National, Departamental, and Neighbourhood routes. The first two groups are under the responsibility of the "Directorate of Roads", and the third one under the responsibility of the Directorate of "Neighbourhood Roads. Both directorates are part of the MOPC.

According to the World Bank, Paraguay’s road network length is estimated at 100,000 km, of which only 32,208 km are classified and managed by the MOPC. Around 68,000 km of the network is under the administration of local authorities. Surveys carried out in 2011 and 2014 over approximately 2 Source: HDR ranking, World Bank.
4,860 km of paved roads indicate that roads are deteriorating rapidly, possibly as a result of insufficient maintenance. As such, while in 2011 some 68 percent of the paved network was in good conditions (measured through its roughness, through the International Roughness Index [IRI] < 3), in 2015, surveys indicate that this figure has dropped to 59 percent. The level of roads in fair conditions, however, increased to 33 percent (3 < IRI < 5), and 9 percent of the network were considered in poor conditions (IRI > 5). The following table shows the road network classification in 2020 according to the MOPC.

<table>

</tr>
</tbody>
</table>

The road network in the country grew from 2016 to 2020. The MOPC carried out a new classification and recategorization of the Paraguayan road network (the last update was carried out in 1962). According to the new information, the Eastern Region of the country, which had 3,494 km of national roads, now has 5,502 km of paved routes. The Paraguayan Chaco added 4 more roads, totaling 3,554 km. Figure 2 shows the layout of the national road network in 2020.

In 2012, the MOPC developed the National Transport Master Plan (2012–2032) to reduce logistic challenges. The current administration has established a long-term road sector strategy based on this plan. The main goals are: (i) completing the key national corridors (bi-oceanic corridor and international corridors); (ii) improving the condition of the existing road assets; (iii) ensuring adequate maintenance to minimize total road user costs and improve road safety; and (iv) ensuring the sustainability of the road programs by prioritizing investments to assure an alignment with available resources while expanding the tolling network to increase the revenues available.

---

1. Bi-oceanic road corridor

The Biocéanico Corridor is the most important project carried out by the MOPC in the Chaco region. The project uses the ‘turnkey’ modality put in place by Law 5074 and entails an investment of USD 445 million. The corridor will connect the most important seaports of the Pacific and Atlantic Oceans. According to the MOPC, “the construction of this Corridor has a high strategic value for Paraguay because it will turn the Western Region into an international logistics center by becoming the shortest route between Chilean and Brazilian ports. The construction of the corridor’s first section, which is 275.73 kilometers long and extends from Carmelo Peralta (Alto Paraguay) to Loma Plata (Boquerón), began in 2019 and ended in 2022.”

---

C. Paraguay’s inland waterway transport infrastructure

As the hydrographic map shows, Paraguay’s Inland Waterway system is very rich. The most important rivers are the Paraguay River (length 1260 km) and the Parana River (length 850 km) because of their flow, extension, and navigability. Nevertheless, all the rivers that run through the Paraguayan territory are part of a large hydrographic basin called the River Plate Basin, a channel that ends in the River Plate and then flows into the Atlantic Ocean.6

---

Paraguay is part of the Paraguay-Paraná Waterway, which consists of 3,442 km of inland waterways that unites 5 countries and runs from Puerto Cáceres (Brazil) to Nueva Palmira (Uruguay). It passes through Puerto Busch (Bolivia), Asuncion (Paraguay), and the ports of the Parana River (Rosario, Zarate), Buenos Aires, Dock Sud and La Plata (Argentina), up to the Recalada sea access. The Paraguay-Parana Waterway Agreement was signed by Argentina, Bolivia, Brazil, Paraguay, and Uruguay in 1991 and is one of the most important and extensive axes of political, economic, and social integration in South America. Its area of influence is approximately 5 million square kilometers and includes a population of about 70 million inhabitants. Paraguay is also part of the Intergovernmental Committee on the Paraguay-Parana Waterway. This body formulates proposals and coordinates policies related to the facilitation of navigation in the Waterway.

Paraguay has the third-biggest fleet of tug-steered barges in the world, behind the United States and China. This fleet transports more than 90% of the intra-zone cargo in the Paraguay-Parana Waterway. That is the intra-zone imports and exports of all the countries that signed the Paraguay-Parana Waterway Agreement (signatory countries are Brazil, Bolivia, Paraguay, Argentina, and Uruguay). The traffic exceeds 30 million tons per year. Although the importance of Parana-Paraguay Waterways is unquestionable, the country has 4 to 5 navigable rivers whose potential is not being used. The volume of traffic in the Paraguay-Parana Waterway, among other factors, has led the country to develop its IWW transport sector. Nevertheless, more investment, particularly in dredging and signage is needed to guarantee navigation throughout the year. The table below provides more information on the Paraguayan fleet.

---

</table>

In 1989, fewer than 100 vessels were using a Paraguayan flag. Currently, there are over 2722. Paraguay implemented a very flexible regime for incorporating vessels to its flag, such as a leasing law that allowed benefits for the incorporation of capital goods and taxes. As a result of these measures, a large number of vessels were incorporated in the 1990’s. 8

Regarding port infrastructure, the country has public and private ports. There are 9 and 38 private ports in the Parana and the Paraguay Rivers, respectively. The National Authority for Navigation and Ports (ANNP) manages 17 ports. Cross-border ports that belong to ANNP are located at the head of bridges with Brazil and Argentina, the parking lots in these ports have a direct connection with the main road and the land terminals of those countries and Bolivia. ANNP is responsible for maintaining the infrastructure that houses government agencies involved in import and export activities.

Furthermore, in 2020, the MOPC issued the decree 4143/20, that simplifies procedures and decreases the operational costs of registering private ports (a reform that in the past required a presidential decree for approval). This measure will reduce the amount of time previously required to register a port by at least 3 months. Lastly, concerning prices, public ports have fixed costs set by decrees while private ports set costs depending on a series of factors, such as the location of the port, the volume of cargo managed by each client, the dynamics of supply and demand in certain scenarios such as drought, pandemics, etc. 9

D. Paraguay’s rail transport infrastructure

In Paraguay, the rail infrastructure is not used to transport cargo. Therefore, rail transport indicators are not included in this report. Nevertheless, it is relevant to mention that there is a two-stop rail line for the transport of passengers between Posadas in Argentina and Encarnación in Paraguay. The Posadas–Encarnación International Train is an 8 km commuter rail international service that started operating in January 2014. It leaves every 30 minutes from each station and can carry 250 people on every trip. The train transports approximately 1 million people every 2 years. 10

Moreover, it is important to indicate that Paraguay is planning to develop such rail infrastructure for cargo transport, with plans that include the construction of a freight train in the southern city of Encarnación, and another freight train that connects the northeast cities of Concepción and Pedro Juan.

---

10 https://encarnacion.gov.py/movilidad-y-transporte/servicio-de-trenes/.
Caballero. This freight train would provide multimodal links between the Paraguay-Paraná Waterways and Ponta Porá-Campo Grande Brazilian Railways, increasing the amount of private investment in the north of the country. Lastly, the bi-oceanic railway corridor will connect the Atlantic and Pacific Oceans and will enhance integration between the MERCOSUR member countries in aspects related to the interoceanic transport of goods and merchandise. According to the South American Council of Planning and Infrastructure (COSIPLAN), the railway integration projects that include Paraguay are the following: (i) a project to connect the port of Santos in Brazil and the port of Illo in Peru, passing through Bolivia and connecting Asuncion-Paraguay, (ii) a project to connect the port of Paranagua in Brazil and the port of Antofagasta in Chile, passing through Paraguay and Argentina, (iii) a project to develop a north-south rail to connect all the rail projects in South America.¹¹

IV. Key findings by group of indicators

A. Border crossing facilitation

This indicator is an aggregate of Efficiency, Time required at borders, Cost, Operations and Information and Communications Technology (ICT), and Intelligent Transport System (ITS) Solutions indicators under the Economic Pillar of SITCIN, to measure the performance of border crossing facilitation.

<td>1-EC-1.2c: BCP infrastructure (parking and terminal facilities)</td>
<td>Availability of appropriate parking and terminal facilities at road BCPs open for international goods traffic.</td>
<td>Paid basic parking facilities are available: 4 points</td>
<td>4 points</td>
<td>Paid parking facilities are available. The customs office is not always in charge of providing or charging for parking facilities. In some cases, this service is provided by private or public ports. A study on import processes in Paraguay was published in 2019. According to this study, provision parking is one of the factors that increases the cost of goods transport in the country. <strong>Note:</strong> In Paraguay, the National Customs Authority is not in charge of providing or charging for parking because the institution is not legally authorized to collect that type of fee. The private company or public institution in charge of managing BCP infrastructure is the one entitled to provide or charge for parking.</td>
<td>Assessment of road and inland waterways import processes in Paraguay (2019) <a href="https://www.uip.org.py/wp-content/uploads/2020/06/DIAGNOSTICO-IMPORTPY-UIP.pdf">https://www.uip.org.py/wp-content/uploads/2020/06/DIAGNOSTICO-IMPORTPY-UIP.pdf</a></td>
</tr>
<tr>
<td>1-EC-1.3: Inland clearance and control procedures for import</td>
<td>The extent to which control procedures for import are undertaken at inland clearance stations away from the border so as to alleviate congestion and efficient movements at the BCPs. The control procedures are involving medico-sanitary inspection, veterinary inspection, phytosanitary inspection, controls of compliance with technical standards, quality controls, vehicle inspections, and weighing of vehicles. The adoption of customs risk management system will get additional points as risk management procedures expedite the clearance of goods.</td>
<td>&lt;4 control procedures take place at inland clearance stations: 4 points Application of customs risk management system: + 2 points</td>
<td>6 points</td>
<td>Weighting of vehicles takes place in inland stations. In addition, the Authorized Economic Operator (AEO) Program uses a risk management tool which allows for the expeditious movement of goods imported or exported by companies that get the AEO certificate. Inland clearance stations mainly serve to carry out documentary control. <strong>Note:</strong> 2 extra points were given because the country uses a risk management system</td>

B. Transport infrastructure

This indicator refers to the infrastructure indicator under the Economic pillar that assesses the availability and quality of routes leading to a cargo BCP and logistic facilities in the proximity of a BCP. Infrastructure indicators under the social pillar of SITCIN measure the availability, quality, and safety of transport infrastructure in the country.

<tr>
<td>1-EC-4.1: Percentage of international road network</td>
<td>Ratio of the total length of international roads to the total road network in the country. International roads concern international motorways, international express roads and international ordinary roads as defined by the AGR (UNECE), and international routes of regional, international and intraregional importance as defined by the Asian highway (UNESCAP), ECLAC, and M network (ESCWA).</td>
<td>Ratio ≥ 4%: 10 points</td>
<td>10 points</td>
<td>Paraguay’s international road network is composed of 4.082 km of paved roads and 2.849 km of unpaved roads (6.930 km in total) while the length of the country’s road network is 78.811 km. Therefore, the percentage of international roads to the total road network is 8.8%.</td>
<td>Directorate for Road Planning Ministry of Public Works and Communications (MOPC)</td>
</tr>
<tr>
<td>1-EC-4.2: Length of international road network per class</td>
<td>Ratio of the total length of class 3 international roads to the total international road network in the country. Class 3 is the lowest class of international roads as defined by the AGR. For the Arab states, this concerns the second-class roads of the M network. In other regions, the road classification might be different. This indicator is about the lowest class as per the classification of the international road network followed by the country.</td>
<td>20% ≤ ratio &lt; 40%: 7 points</td>
<td>7 points</td>
<td>Paraguay does not use the road classification mentioned in the ESCWA Agreement on International Roads in the Arab Mashreq. Nevertheless, to answer this question it is assumed that class 3 roads entail unpaved roads or roads with designs speed below 100km/H. Taking this definition into consideration, the percentage of the total length of class 3 international roads to the total international road network in the country is approximately 33.4% or 2.314 km (at the moment the Ministry of Public work is paving 512 km of the international road network. Once the construction contract comes to an end, these roads will have design speeds above 100 km/hr).</td>
<td>Directorate for Road Planning Ministry of Public Works and Communications (MOPC)</td>
</tr>
<tr>
<td>1-EC-4.3: Harmonization of road classes at BCP</td>
<td>The number of country’s BCPs with harmonized road classes within 50 km of a BCP. When the roads on one side of a BCP are for instance class 1 roads, while the roads on the other side of the BCP are class 3 roads, this situation is unharmonized and creates a bottleneck.</td>
<td>Entirely harmonized (100%): 10 points</td>
<td>10 points</td>
<td>All BCPs have harmonized road classes (note that road classes are also considered harmonized if there are class 3 roads on both sides of the BCP.</td>

C. Safety & security

The Road Traffic Rules/Behavior indicators aim to measure the effectiveness of the provision of road signs and signals, road traffic rules, driver’s driving times enforcement, etc., in reducing the number of road traffic accidents. The Vehicle Regulations indicators measure the effectiveness of harmonized vehicle and packing regulations in increasing traffic safety in both mode-specific and intermodal transport operations.

D. Transport of perishable foodstuffs and dangerous goods

This indicator refers to the Perishable Foodstuffs Transport and Dangerous Goods Transport under the Social pillar of SITCIN, to measure the extent to which the safety of transporting perishable foodstuffs and dangerous goods is maintained. These indicators aim can help to harmonize national legislation with relevant international regulations and rules, administrative procedures and documentation requirements and to reduce the number of deaths and illnesses from hazardous chemicals and air, water and soil contamination resulting from transport operations.

<td>1-SO-4: Perishable Foodstuffs Transport</td>
<td>Degree of harmonization of internationally/regionally agreed provisions on the list of perishable foodstuffs and corresponding transport conditions, in the national laws and legislations.</td>
<td>In accordance with regionally agreed provisions: 5 points</td>
<td>5 points</td>
<td>There are three different institutions in charge of perishable foodstuff. The National Institute for Food and Nutrition (INAN) which is in charge of the safety and quality of processed foodstuffs. The National Service for Animal Health and Quality (SENACSA) which is in charge of meat products. The National Service for Plant and Seed Quality and Health (SENAVE) which is in charge of the safety of fresh fruits and vegetables (however, fruits and vegetables unless processed are not covered by the Agreement on the International Carriage of Perishable Foodstuffs and on the Special Equipment to be Used for such Carriage ATP). SENAVE and INAN have not developed regulations on transport of perishable foodstuffs. Provisions regarding equipment to transport perishable foodstuffs were developed by SENACSA, in part because beef is one of Paraguay's most important export products. The regional bloc MERCOSUR has issued many provisions regarding production and trading of meat products. SENACSA has implemented several of MERCOSUR's guidelines. In addition, the Municipality of Asunción issued municipal ordinances that regulate the transport of perishable foodstuffs, carries out inspections and issues compliance certificates.</td>

<tbody>
<tr>
<td>1-EC-6: Intermodality/Combined Transport</td>
<td>Ratio of the freight ton kilometers performed with road transport modes to the total ton kilometers involved in international (transit) journeys per year.</td>
<td>10% ≤ ratio &lt;25%: 8 points</td>
<td>8 points</td>
<td>IWW transport is the most widely used transport mode in the country, around 80% of the movement of cargo is performed through IWW and around 20% is performed with road transport modes.</td>
<td>Merchant Navy Administration (DGMM)</td>
</tr>
<tr>
<td>1-EC-6.1: Modal share of freight road transport</td>
<td>National law adheres to regional intermodal transport agreement: 8 points</td>
<td>8 points</td>
<td>There are a couple of provisions that pertain to this point. On one hand, Argentina, Bolivia, Brazil, Chile, Paraguay, Peru and Uruguay entered a regional agreement on international road transport in 1991 (ATIT). The Paraguayan Congress approved this agreement and adopted it as national legislation through Law 1128/97 (nevertheless, the Executive Power has enacted administrative decisions to implement the agreement since 1991). The Transport Authority further regulated its implementation through Decree CD N° 53/02 regarding national and international road transport of cargo. On the other hand, there is an intermodal agreement within MERCOSUR incorporated into national laws through the presidential decree 16.927/97.</td>
<td>Presidential decree 16.927/97: <a href="http://www.moringoyasociados.com/todas_disposiciones/1997/decretos/decreto_16927_97.htm">http://www.moringoyasociados.com/todas_disposiciones/1997/decretos/decreto_16927_97.htm</a> Law n° 1128/97: <a href="http://www.dinatran.gov.py/descritos/ley1128.pdf">http://www.dinatran.gov.py/descritos/ley1128.pdf</a> National Transport Authority (DINATRAN) Decree CD N° 53/02 which regulates the national and international road transport of cargo: <a href="http://www.dintran.gov.py/descritos/carga5302.pdf">http://www.dintran.gov.py/descritos/carga5302.pdf</a></td>
<td></td>
</tr>
<tr>
<td>1-EC-6.2: System approach to intermodal transport</td>
<td>75% ≤ share &lt;50%: 7 points</td>
<td>7 points</td>
<td>Around 80% of the movement of cargo is performed through IWW that involves multimodal transport.</td>
<td>Merchant Navy Administration (DGMM)</td>
<td></td>
</tr>
<tr>
<td>Indicator</td>
<td>Definition</td>
<td>Scoring</td>
<td>Score</td>

</tr>
<tr>
<td>-----------</td>
<td>------------</td>
<td>---------</td>
<td>-------</td>
<td>--------</td>
<td>--------</td>
</tr>
<tr>
<td>1-EC-6.4: Share of containerized cargo</td>
<td>The share of containerization is defined as the gross weight of containerized cargo divided by the gross weight of international (transit) non-bulk cargo. Oil, coal, grain, bulk, cement, etc., are excluded.</td>
<td>10% ≤ share &lt;25%: 4 points</td>
<td>4 points</td>
<td>No data available. Nevertheless, Paraguay has seen an increase in terms of containerized cargo transport volumes, both in imports and exports. In 2011, Paraguay transported 145,000 TEUs and by the end of 2018, the country transported around 220,000 TEUs. This change in transport volumes represents a growth of 50%. Therefore, it can be said that the share of containerized cargo can be around 10%.</td>

<td>1-EV-2: Emission</td>
<td>The level of stringency of the national vehicle emission legislation concerning the minimum emission standard for new vehicles.</td>
<td>Euro 1-3 (or equivalent): 2 points</td>
<td>2 points</td>
<td>Paraguay’s Air Quality law was approved in 2014. However, this law does not use euro pollutant emission standards and classification. Nevertheless, in 2015 the Ministry of Public Works issued a provision whereby it establishes that new buses should comply with euro 3 regulations. In addition, the country has strongly regulated the quality of diesel and petrol. Diesel sulphur content is as low as 10ppm and not higher than 50 ppm which could allow euro 4 or euro 6 vehicles to circulate. Petrol sulphur content is not higher than 150ppm which would allow euro 3 vehicles to circulate in the country. Furthermore, in 2018 the Secretary for the Environment (now Ministry of Environment and Sustainable Development) issued Provision 78/18 which establishes maximum levels of air pollutants from automobiles. Municipalities are in charge of measuring CO emissions. However, not all municipalities have implemented the regulations</td>

| 1-EV-2.3: Noise emissions | The application of noise regulations, restricting the amount/duration/source of noise, to reduce excessive noise levels of motor vehicles. | Requirements applied to powertrain noise: 3 points | 10 points | Noise pollution used to be regulated by law 1100 which was enacted in 1997. A new law 6390 pertaining to noise pollution was passed in early 2020 overturning the previous one. According to law 6390 municipalities are in charge of implementing policies in order to gradually reduce pollution, establish permitted pollution levels, and harmonize provisions with international and regional agreements. As a result, rules regarding this matter are very decentralized. In order to fully assess this topic, it is necessary to analyse provisions of 254 municipalities. Nevertheless, for this study a couple of decrees were analysed and there is a tendency to apply requirements to the following: powertrain noise, audible warning signals, wet grip, tire noise, replacement silencers. (Note on scoring: requirements applied to powertrain noise:3 points, requirements applied to tire noise alone: 2 points, combined with wet grip: 3 points, requirements applied to audible warning signals (horn): 2 points, requirements applied to replacement silencers: 1 point, requirements applied to acoustic vehicle alerting system (AVAS): 1 point). | Law 6390 concerning noise pollution:

## 1-EV-2.5: Application of models to predict weather-related risks

**Indicator**: Degree of application of operational models/software tools to predict weather-related risks to transport infrastructure. It concerns the application of the following tiers according to the Intergovernmental Panel on Climate Change (IPCC): tier 1: simplest method with default values; tier 2: similar to tier 1 but with country-specific emission factor and other data; tier 3: more complex approaches (models).

V. Paraguay’s overall score

Formula 1. Overall score calculation:

\[
\text{country overall score} = \frac{\sum \text{country score by each subchapter} \times \text{maximum overall score}}{\sum \text{maximum score by each chapter}}
\]

The country’s final/overall score is a weighted number. Each transport mode score is weighted, and the final Overall Country score is calculated based on the weighted scores.

### Strength

**IWW transport**
- Port costs are lower than the regional average.
- The entire IWW network currently in use is covered by at least one River Information System technological solution. The most widely used is VHF radio since its use is mandatory according to the technical inspection forms issued by the Naval Command Center.
- Most if not all vessels have an Electronic Chart Display Information System because it is the tool that captains are trained to use.
- Inland waterways are equipped with Automatic Identification System (AIS).
- Harmonization and recognition of certificates (such as boat master’s certificates) is limited and further work is needed for type approval and standardization.

**Road transport**
- There are provisions covering road signs, signals, and markings.
- National legislation covering road signs, signals, and marking is not harmonized with international standards.
- The provision of rest and service areas, the number of toll and border crossing control lanes do not take into account the volume of traffic anticipated. This type of consideration is not possible sometimes because of poor BCP physical infrastructure.
- The country does not have many International Roughness Index (IRI) studies.
- No public data available concerning the number of cases of reported cargo theft.

### Weakness

**IWW transport**
- The country does not use intelligent transport systems at and around BCPs, such as traffic light management, automatic vehicle registration number recognition, and automatic container recognition. In addition, there is a low degree of implementation of Roadside Intelligent Transport systems. There are video monitoring systems, variable message signs (VMS), and equipment for speed enforcement but their availability is heavily concentrated in the country’s capital.
- The country does not use intelligent traffic management systems along roads leading to BCPs to notify approaching trucks of the traffic situation at BCP (i.e., traffic occupancy, processing and queuing time, and providing early recommendations such as postponing entry to BCPs or deviate to other BCPS).

**Road transport**
- Poor physical infrastructure is one of the most significant bottlenecks. There is not enough space for parking. In addition, infrastructure does not always belong to the customs office. As a result, the customs office is not always in charge of providing or charging for parking facilities. In some cases, this service is provided by private or public ports. Therefore, it is harder to implement a unified overarching policy.
- High cost of detection equipment, and non-intrusive inspection technologies including scanners for cargo.
- High cost to roll out application of intelligent transport systems and intelligent traffic management systems.

### Opportunity

**Road transport**
- The National Customs Authority is implementing a program called Authorized economic operator which simplifies procedures for certified companies and relieves traffic at BCPs.
- The customs office plans to implement fast lanes and traffic separation in order to give priority to vehicles under cover of Authorized Economic Operator (AEO) certificates.
- Data on time spent at the border can be obtained using SOFIA (System for the Fiscal Organization of Customs Levies).
- Electronic cargo manifest systems (e-CMR) such as TEMAFLU are being implemented.

**IWW transport**
- In 2020, the National Transport Authority (DINATRAN) started equipping national trucks with Radio-frequency identification (RFID) tags. The company Tape Pora also started to implement RFID tags for Electronic Toll Collection (ETC). The systems could be integrated.
- In June 2023, the congress approved a law that makes it mandatory to have scanners in primary customs zones and special surveillance areas.
- The Intergovernmental Committee on the Paraguay-Paraná Waterway provides a solid platform to develop advances in the harmonization and mutual recognition of boatmaster's certificates.

### Threat

**Road transport**
- Poor physical infrastructure is one of the most significant bottlenecks. There is not enough space for parking. In addition, infrastructure does not always belong to the customs office. As a result, the customs office is not always in charge of providing or charging for parking facilities. In some cases, this service is provided by private or public ports. Therefore, it is harder to implement a unified overarching policy.
- High cost of detection equipment, and non-intrusive inspection technologies including scanners for cargo.
- High cost to roll out application of intelligent transport systems and intelligent traffic management systems.

**IWW transport**
- There is no other platform as relevant as the Intergovernmental Committee on the Paraguay-Paraná Waterway. Inland Waterways that are not part of the Paraguay-Paraná Waterway agreement do not have the same requirements and standards as the waterways that are part of the agreement.

#### Safety & security SWOT analysis

<table>
<thead>
<tr>
<th>Strength</th>
<th>Weakness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Road transport</td>
<td>The rules for drivers and professional drivers are not harmonized with the UN Convention on Road Sign and Signals (1968) and the level of enforcement is not the same in every municipality. The enforcement of transit rules is low. Currently, there is no National Road Safety System in place. MERCOSUR’s provision 75/95 on periodic technical inspection (PTI) did not set rules for new vehicles and did not establish the mutual recognition of national rules pertaining to PTI among member countries. Law 3850/2009 implemented Periodic Technical Inspections. While this law is regarded as positive, the lack of application of PTI in private vehicles and the lack of mandatory automobile liability insurance means a higher risk for road cargo transport and citizens. Commercial vehicles are not equipped with tachographs. The National Agency for Road Safety has not issued a regulatory decree for the use of technological means in automated road traffic enforcement taking into account art. 146-152 of Law 5016/14. This decree is necessary for the application of intelligent traffic management systems mentioned in indicator1-EC-7.5 &amp; 1-EC-7.9. IWW transport The Naval Command Center has data on navigation related accidents or violation of navigation rules available. However, they do not publish it.</td>
</tr>
<tr>
<td>IWW transport</td>
<td>Equipping trucks with tachographs can be challenging. High loan interest rates can negatively affect the willingness to invest in these devices. In addition, it should be noted that transport companies do not always own all the trucks in their fleet, sometimes they lease trucks from different individuals or directly hire drivers who own trucks. The dispersion of ownership can hamper the coordination of common actions because purchasing power and priorities among actors may be significantly different.</td>
</tr>
<tr>
<td>The international IWW corridors and coastal routes that pass through the country connect Paraguay to all its immediate neighbors plus Uruguay (Argentina, Brazil, Uruguay, Bolivia). IWW transport Navigation throughout the year is not guaranteed. Navigation is heavily concentrated on the Paraná-Paraguay Inland Waterways (from Puerto Caceres in Brazil to Puerto Nueva Palmira in Uruguay). There are 4 or 5 navigable rivers in Paraguay whose potential is overlooked.</td>
<td></td>
</tr>
<tr>
<td>Opportunity</td>
<td>Threat</td>
</tr>
<tr>
<td>Road transport</td>
<td>The National Agency for Road Safety is currently working to ratify and harmonize UN conventions of traffic such as the UN Convention on Road Traffic and the UN Convention on Road Signs and Signals (1968). The National Transport Master Plan developed by the Ministry of Public Works and Communications (MOPC) could provide a meeting point and common ground place for the public and private sector involved in IWW transport.</td>
</tr>
<tr>
<td>IWW transport</td>
<td>There is no record of common and harmonized action between public institutions and the private sector involved in IWW transport and cooperation as well as fluent communication is needed for a successful dredging plan and maintenance of IWW.</td>
</tr>
</tbody>
</table>

**Source:** Self-made.
MERCOSUR’s sub working group no. 5 is revising and updating provision 75/95 on periodic technical inspection (PTI). The National Transport Agency (DINATRAN) will participate in this revision. There are discussions among agents in the transport business concerning the use of tachographs.

IWW transport

The highway police publish statistics reports. The Naval Command Center could use the highway police knowhow as a starting point and adapt their reports to publish navigation related data.

VII. Social development considerations outside the scope of SITCIN’s connectivity indicators

SITCIN’s methodology addresses many of the priorities of the Vienna Programme of Action (VPoA), since the VPoA is a plan adopted by the United Nations to address the unique challenges faced by Landlocked Developing Countries.12 Nevertheless, there are some topics not included in VPoA and consequently also omitted in SITCIN’s methodology. This section aims to review these topics and place them under SITCIN’s Pillar of Economic Sustainability.13 Note that according to the SITCIN’s methodology, Economic Sustainability refers to practices that support long-term economic growth without negatively impacting other aspects of development.

A. Impact of infrastructure projects on indigenous communities

The section concerning Paraguay’s road transport infrastructure mentions that the Bioceanic Corridor is the most important construction project carried out by the MOPC in the Chaco region. The infrastructure project will connect the most important seaports of the Pacific and Atlantic Oceans and has a high strategic value for the country. Nonetheless, the project also has negative consequences for the region’s indigenous communities.

A study carried out in 202014 explores the corridor’s impact on the Ayoreo, an indigenous community that has inhabited the Departments of Alto Paraguay and Boqueron in the Chaco Region for centuries. Through interviews with indigenous leaders, the study gathers information on their level of satisfaction with government commitments to the community as well as positive or negative consequences of the corridor.

12 Some of the challenges include high transportation costs and the need for infrastructure development. The VPoA can be found here: https://www.un.org/en/landlocked/vienna-programme-action#:~:text=The%20Vienna%20Programme%20of%20Action%20(VPoA)%20is%20a%20plan%20adopted%20by%20Landlocked%20Developing%20Countries%20(LLDCs).
13 Economic Sustainability refers to practices that support long-term economic growth without negatively impacting other aspects of development.
As a signatory of the Indigenous and Tribal Peoples Convention (ILO Convention 169), the Paraguayan government is required to apply 'Prior Informed Consent Mechanisms' before conducting any activity that might have a direct or indirect impact on indigenous communities or peoples. Thus, in 2018 the Paraguayan Ministry of Public Works started a dialogue with the Ayoreo. Some of the commitments included furnishing community centers, installing fences in areas near the community's property, conducting training sessions, hiring people from the community to build the road, and creating an Inter-Institutional Committee to address emerging needs.

Interviewees state that most commitments were not fulfilled at the time the interviews took place, they mentioned that the government started installing fences but did not finish it. They also indicated that the consultation process itself was rushed and as a result, they were asked to prioritize demands. The only agreement that was fully implemented was hiring members of the community for road works but the workers suffered from poor working conditions. For instance, they were not paid extra hours and some were not included in the country's social security system even though they paid the fee to be included.

Lastly, improving road access, including the partial access granted to the construction companies before the road is finished, increases the incidence of illegal activities. Interviewees identified the following negative impacts: illegal poaching, illegal logging for timber extraction, illegal mining of a quarry located within Ayoreo territory, and trafficking in persons. On the other hand, they mention that positive aspects may include transport of products and access to hospitals (if ambulances are provided).

Finally, since it is clear that some infrastructure projects impact the lives of indigenous communities, instruments such as the VPOA could include aspects of the ILO Convention 169 in its priority areas.

B. Gender equality

The VPoA, does not address gender equality in any of its 6 priority areas. An assessment of the Implementation of the VPoA in Latin America calls for the inclusion of this topic by highlighting the need to reduce the digital divide in LLDCs, both in terms of gender and between regional and urban locations, as well as the need to improve access to the telecommunications systems, develop broadband infrastructure, facilitate Internet access, and reduce tariffs through greater competition in the sector. These topics are aligned with priority 2 of the VPoA, concerning the Development and maintenance of transport, energy, and ICT infrastructure.

C. Climate change

Although SITCIN'S methodology does include 3 indicators related to climate change, this issue is not included as a priority area in the Vienna Programme of Action. An assessment of the Implementation of the VPoA in Latin America calls for the inclusion of this topic, indicating that the Plurinational State of Bolivia and Paraguay are critically vulnerable to the effects of climate change due to their geographic location, population distribution, and economy based on natural resources.

Fortunately, during the Latin America Regional Review Meeting of the VPOA, held in Paraguay in 2023, delegates agreed to address climate change. The steps ahead include: formalizing the LLDC Group under the United Nations Framework Convention on Climate Change (UNFCCC) process, calling
on the United Nations Climate Change Conference (COP 28) to consider the impact of climate change on LLDCs in the deliberations and outcomes, and inviting climate finance providers to improve access for LLDCs.

Lastly, it was noted that Latin American LLDCs continue to be heavily affected by floods, storms, droughts, forest fires and other hazards which implies they are highly vulnerable to the adverse effects of climate change. Sudden and slow-onset disasters on these LLDCs, as well as in transit countries, have a direct cost on transit trade, which subsequently limits the ability of Latin American LLDCs to compete in the global marketplace.

D. National statistical systems

The assessment of the Vienna Programme of Action in Latin America also indicates that changes should go hand in hand with improving national statistical systems. The political declaration of the High-level Midterm review of VPoA, underlines the need to gather data to monitor the specific objectives of the program. At the High-level Midterm Review conducted in 2019 (within the framework of the United Nations General Assembly), a commitment was made to provide the necessary training to strengthen the national statistical systems of landlocked developing countries.18

Furthermore, during the Latin America Regional Review Meeting of the VPOA, held in Paraguay in 2023, delegates recognized the need to strengthen statistical capacities within Latin American LLDCs and calls on development partners, the UN system and other international organizations to support LLDCs in this regard. The call says that accurate data collection and analysis is critical to monitor progress, understand demographic dynamics, make evidence-based decisions and formulate policies conducive to sustainable development even in emergency contexts.

VIII. Conclusion

As previously mentioned, this report updated some indicators of Paraguay’s National Connectivity Report (NCR) published in 2020 and included a new section concerning social development considerations that were outside the scope of the NCR and its Sustainable Inland Transport Connectivity Indicators (SITCIN).

Paraguay’s National Connectivity Report was written based on the analysis of 161 indicators that were developed exclusively for landlocked countries. These indicators were designed to provide an evidence-based transport policy framework that can promote sustainable transport connectivity at the national, regional, and international levels while fostering the implementation of transport-related SDGs. In the case of Paraguay, the indicators covered two transport modes, road and Inland Waterways (IWW), and six groups of sub-indicators also called NCR chapters. These chapters include border crossing facilitation, transport infrastructure, safety and security, transport of perishable foodstuffs and dangerous goods, intermodality, environment, and energy. Data were collected to evaluate 161 indicators in total, 121 indicators for road transport and 40 indicators for IWW transport, some indicators were not evaluated due to lack of data.

In the case of road transport, Paraguay scored higher on indicators related to safety and security and on transport of dangerous goods. This can be explained because the country has had a comprehensive and solid road safety legislation since Law 5016 was passed in 2014. Nevertheless, it is important to note that the level of enforcement of this law is low. The country also has comprehensive and solid legislation regarding the transport of dangerous goods. The lowest scores are related to border crossing indicators, in part because there are no fast lanes at Border Crossing Points and no fast-track treatment for perishable foodstuffs. Nonetheless, it is important to indicate that Paraguay is putting in place the Authorized Economic Operator (AEO) program which could counterweight the lack of fast lanes. A detailed description of strengths and weaknesses in each category of indicators can be found in the SWOT analysis section.
In terms of Inland Waterways (IWW) transport, Paraguay also scored higher on indicators related to safety and security and the transport of dangerous goods. This result can be explained because the country adopted and harmonized its rules with many international agreements such as the International Convention for the Safety of Life at Sea (SOLAS) agreement. Intermodality and environmental indicators have the lowest scores, partly because ports and main roads are poorly connected, and the country has not implemented measures to address climate change impacts on inland waterways systems.

In terms of infrastructure, indicators related to ports’ infrastructure scored high due to their high rates of cargo handling capacity. That being said, more work is needed on IWW infrastructure. More investment is needed (for dredging, signage for night-time navigation and maintenance) to guarantee navigation throughout the year. A detailed description of strengths and weaknesses in each category of indicators can be found in the SWOT analysis section.

Finally, section eight of this document briefly introduced social development considerations outside the scope of connectivity indicators. The section discussed the impact of infrastructure projects on indigenous communities and the need to include principles of gender equality, climate change, and improved national statistical systems in programs such as the VPOA. The following section contains recommendations developed and summarized based on the country’s performance in each set of indicators and the SWOT analysis presented in the previous chapter.
IX. Recommendations

Table 19
Border crossing facilitation recommendations

<table>
<thead>
<tr>
<th>Public sector</th>
<th>Target institutions(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Take steps to implement fast lanes/fast track treatment for trucks carrying live animals and perishable foodstuffs.</td>
<td>For measures that require changes infrastructure at BCPs: ANNP, Ministry of Public Works and Communications (MOPC) For measures that entail implementing programs to facilitate movement of perishable foodstuffs: National Customs Authority (DNA)</td>
</tr>
<tr>
<td>2. Publish data on border clearance time which can be obtained using SOFIA (System for the Fiscal Organization of Customs Levies).</td>
<td>National Customs Authority (DNA)</td>
</tr>
<tr>
<td>3. Work closely with border agencies to integrate information systems in order to avoid repetitive work (double weighting, double scanning) at BCPs.</td>
<td>National Customs Authority (DNA)</td>
</tr>
<tr>
<td>4. Consider implementing pre-trip traffic information systems to make international drivers aware of the traffic situation and travel conditions. This system could also notify approaching trucks on the traffic situation at BCP such as traffic occupancy, processing and queuing time, and provide early recommendations such as postponing entry to BCPs or deviating to other BCPs.</td>
<td>National Customs Authority (DNA)</td>
</tr>
<tr>
<td>5. Consider extending BCPs working hours to facilitate an expeditious movement of goods.</td>
<td>All the public institutions involved in activities at BCPs</td>
</tr>
<tr>
<td>6. Consider setting up a cooperation mechanism to harmonize the use of Radio-frequency identification (RFID) tags with the Company Tape Pora.</td>
<td>National Transport Authority (DINATRAN)</td>
</tr>
<tr>
<td>7. Set up a cooperation mechanism to further develop the use and integration of Radio-frequency identification (RFID) tags. For instance, the Ministry of Industry and Commerce has drafted a project called 'Cargo systems in international commerce' that aims to create a cargo module within the single window for exports (VUE) in order to register cargo, transit and transport information in a single place and improve control, traceability and obtain real time information on available transport capacity. RFID technology would help this project to attain its objectives.</td>
<td>National Customs Authority (DNA) National Transport Authority (DINATRAN)</td>
</tr>
<tr>
<td>8. Take steps to implement the recognition of driving permits based on the UN Conventions on Road Traffic and Harmonization Convention.</td>
<td>National Agency for Road Safety (ANTSV)</td>
</tr>
<tr>
<td>9. Take steps to harmonize and recognize international certificates (such as boat master's certificates), work on type approval and standardization.</td>
<td>Naval Command Center</td>
</tr>

4. Consider including Post-Crash Response standards and procedures of the UNRSTF Global Framework Plan of Action for Road Safety (GFPARS) in the new National Road Safety Plan.a

5. Consider issuing a regulatory decree for the use of technological means in automated road traffic enforcement taking into account art. 146-152 of Law 5016/14.

6. Consider publishing statistical reports to record navigation related accidents and violation of navigation rules. The Naval Command Center could adapt the highway police statistical reports to publish navigation related data.

1. Take into account the UN Agreement on Vehicle Regulations (https://unece.org/fr/node/3492) for new vehicles to update MERCOSUR’s provision 75/97 on technical inspections.

2. Publish data regarding the percentage of traffic classified as dangerous goods on the international road networks.

3. Take steps to update national regulations in light of MERCOSUR’s provision CMC N° 15/19 which takes into account the newest versions of United Nations rules, the European Agreement on the Transport of Dangerous Goods by Road (ADR) and the International Regulations on the Transport of Dangerous Goods by Rail (RID).

4. Consider transport conditions for dangerous goods in the ongoing plans to develop rail infrastructure in Paraguay. MERCOSUR offers a solid platform to do so. The ‘Sectoral Agreement for Transport of Dangerous Goods in MERCOSUR’ was developed taking into account the International Regulations on the Transport of Dangerous Goods by Rail (RID).

5. Publish data regarding the percentage of traffic classified as dangerous goods on the Inland Waterway Network.

*a These standards consist of the following 8 actions: (i) Introduce legal requirement for anyone to perform first-aid activities within his/her capacity, (ii) Introduce standards for post-crash professional emergency response, (iii) Introduce framework for rehabilitation programs, (iv) Establish a link between liability insurance and financing of care for crash victims, and rehabilitation programs (v) Enable multi-disciplinary crash rescue operation and investigation, (vi) Introduce a clear framework for crash investigation and data collection, (vii) Designate authorities responsible for implementation including enforcement of the existing standards as well as for their further development, as necessary, (viii) Assess effectiveness and completeness of standards (completeness of standards benchmarked against international regulatory framework).

Bibliography

In 2020, Paraguay’s National Connectivity Report was prepared as part of the United Nations Development Account project “Sustainable transport connectivity and implementation of transport-related SDGs in selected landlocked and transit/bridging countries”. The report contains 161 indicators that assess rail, road, and inland waterway transport in Paraguay, concerning areas such as the regulatory and administrative framework for border crossings, quality of transport infrastructure, quality of regulations on transport of dangerous goods and perishable foodstuffs, and efforts to reduce emissions of greenhouse gases and other atmospheric pollutants, and noise emissions.

This document updates the indicators and extends their reach by including a new section on social development. In the current context, given the challenges the world is facing, it is crucial to consider the International Labour Organization (ILO) Indigenous and Tribal Peoples Convention, 1989 (No. 169) as well as gender equality, climate change, and improved national statistical systems when developing the Vienna Programme of Action for Landlocked Developing Countries for the Decade 2014–2024.

National Connectivity Reports are an excellent tool for landlocked developing countries to voluntarily evaluate and report progress implementing the 2030 Agenda for Sustainable Development and the Vienna Programme of Action.
